

Résultats des mesures de fiabilité des cartes de couverture des opérateurs mobiles réalisées en 2009

Les pourcentages expriment le taux de fiabilité, c'est à dire le taux d'appels réussis et maintenus dans les zones réputées couvertes par les opérateurs. Il correspond à l'indicateur « taux de couverture en zone réputée couverte » du protocole du 20 février 2007.

Nota Bene : cet indicateur n'exprime pas le taux de couverture de l'opérateur mais l'exactitude de la carte de couverture publiée par celui-ci. Notamment du fait des aléas de la propagation radioélectrique, une cohérence de 100% est très difficilement atteignable.
