

COMMISSION OF THE EUROPEAN COMMUNITIES

Brussels, 2.12.2004
SEC(2004)1535

VOLUME II

COMMISSION STAFF WORKING PAPER

Annex to the :

**European Electronic Communications Regulation and Markets 2004
(10th Report)**

{COM(2004)759 final}

ANNEX 3

MARKET OVERVIEW

SOURCES OF DATA PRESENTED IN THIS ANNEX

The data presented in the section on the value of the communications market come from the European Information Technology Observatory (EITO) 2004. National regulatory Authorities (NRAs) and the European Commission have agreed to use these data as a proxy for the overall market value and its breakdown by segments. These data were prepared by IDC and the EITO Task Force on the basis of the information available as of December 2003.

Figures in sections 2 (players in the fixed market), 3 (consumers' choice of fixed operators), 4 (public network interconnection charges), 5 (mobile operators), 6 (number portability) and 7 (broadband access pricing) were provided by the National Regulatory Authorities (NRAs) in response to a questionnaire on regulatory market data sent by the Commission in June 2004.

Data on mobile subscribers (section 5) refer to the end of June 2004 and come from the NRAs and, where NRAs do not have figures for the end of June, from the European Mobile Communications Report.

Data in section 7 on the number of broadband lines are provided by the NRAs and the national ministries through the Electronic Communications Committee (COCOM). Data have been collected since July 2002 three times a year, in January, June and October. The figures in this report refer to 1 July 2004.

Information in sections 8 & 9 (PSTN and retail leased lines pricing comparisons) is taken from a study carried out for the Commission by Teligen-HI Europe. These data are collected from primary sources (i.e. directly from the incumbent operators and new entrants) and checked by the NRAs. All NRAs, with the exception of Cyprus, Spain and Luxembourg, provided comments and endorsed these data.

This annex includes information from the 10 New Member States that joined the European Union in May 2004 (Estonia, Latvia, Lithuania, Poland, Czech Republic, Slovakia, Hungary, Slovenia, Malta and Cyprus). In some cases information on indicators is unavailable, with the result that some Member States are not included in some of the charts. Footnotes below these charts indicate when this situation occurs.

A draft version of the charts in this annex was distributed to the NRAs before this report was finalised and a validation meeting with representatives from NRAs and National Ministries took place on October 11.

TABLE OF CONTENTS

1.	ESTIMATED SIZE AND GROWTH OF THE EU TELECOMMUNICATIONS MARKET	6
2.	PLAYERS IN THE FIXED MARKET	10
2.1.	Players in the fixed market.....	10
2.2.	Public fixed network operators	11
2.3.	Public fixed voice telephony operators	12
2.4.	Incumbents' market share in the fixed voice telephony market	15
2.5.	Public ownership of the incumbent operator	22
3.	CONSUMERS' CHOICE OF FIXED OPERATORS.....	23
3.1.	Percentage of subscribers actually using an alternative provider other than the incumbent.....	23
3.2.	Facilities used by new entrants for the provision of voice telephony	28
4.	PUBLIC NETWORK INTERCONNECTION	31
4.1.	Fixed-to-fixed interconnection charges.....	31
4.2.	Fixed-to-mobile interconnection charges.....	34
4.3.	Leased lines interconnection charges.....	40
5.	MOBILE MARKET	44
5.1.	2G mobile penetration.....	44
5.2.	Players in the mobile market.....	51
5.3.	3G players	52
5.4.	2G operators' market shares.....	55
5.5.	Mobile basket	57
6.	NUMBER PORTABILITY	62
6.1.	Fixed number portability.....	62
6.2.	Mobile number portability	63

7.	BROADBAND ACCESS AND PRICING	67
7.1.	Broadband access	67
7.2.	Wholesale access.....	68
7.3.	Retail broadband access	73
7.4.	Prices for unbundled local loop.....	84
8.	PUBLIC VOICE TELEPHONY TARIFFS	88
8.1.	Charging system.....	89
8.2.	Monthly rental charged by the incumbent operators.....	92
8.3.	Average monthly expenditure (composite call basket).....	93
8.4.	Price of fixed national calls by the incumbent operator.....	96
8.5.	Trend of the basket for fixed national calls (national basket).....	98
8.6.	Price of fixed national calls by alternative operators	100
8.7.	Incumbent operator price for an average fixed international call (international call basket)	102
8.8.	Incumbent operator price of calls to EU, Japan, USA	105
8.9.	Alternative operators' price for fixed international calls	108
9.	LEASED LINES RETAIL TARIFFS	110
9.1.	Incumbents' national leased lines	110
9.2.	National leased lines price trends (1 august 1998 - 1 august 2003).....	120
9.3.	International leased lines prices	121
9.4.	International leased lines price trends (1 august 1998 - 1 august 2003)	127
10.	EXCHANGE RATES	128
10.1.	Exchange rate used in section 5 on the mobile basket, section 8 on public voice telephony tariffs and section 9 on leased line tariffs.....	128
10.2.	Exchange rate used in all the other sections.....	128
11.	OECD TELECOMMUNICATIONS BASKET DEFINITIONS.....	130
11.1	National PSTN basket	130
11.2.	International PSTN basket	132
11.3.	Composite national – international basket	132
11.4.	New OECD Mobile Baskets	133

1. ESTIMATED SIZE AND GROWTH OF THE EU TELECOMMUNICATIONS MARKET

This section provides estimates of the value of the EU telecommunications market and its breakdown into main segments (voice telephony, mobile services, switched data and leased line services).

All the data presented here are expressed in end-user spending. Data for all years of the historical and the forecasted period are expressed in nominal terms.

Figures for 2004 are forecasts by the European Information Technology Observatory (EITO). Actual values, calculated ex post, might differ from those provided here.

EITO provides a combined estimate for Belgium and Luxembourg. The figures given in the following charts are estimates based on the relative numbers of fixed lines and mobile subscribers in each of the two countries. The data for Cyprus and Malta have been estimated by the Commission.

The charts below show the value of the telecommunications market, which encompasses the following segments as defined by EITO:

Fixed voice telephony services: This segment includes carrier service revenues for residential, business, national and international voice services. It includes services used primarily to transport or enhance voice communication via the circuit switched telephone network (fax machine traffic is included in fixed voice services. It includes local and long distance calling, fixed-to-mobile; fixed charges (line rentals and connection fees), and revenue from enhanced services, such as call forwarding and caller identification. Internet and online services are not included in this segment. They are counted in fixed data services.

Fixed data services: Services that can be used to transport data via fixed lines. Increasingly, data technologies allow for voice and data to travel via the same network and/or technologies. For example, IP technology is increasingly used to transport voice. In such cases, the voice portion is not separated from the data communications revenue – both are included in the data revenue. Fixed data services include packet/cell services, Internet access (including dial-up), broadband (including broadband revenues over cable modem), VoIP, and IP VPN.

Mobile telephone services: This segment includes cellular/personal communications services (PCS), Specialized Mobile Radio (SMR), mobile data networks, and mobile satellite services. It includes voice and data and enhanced services, such as location-based services. Mobile data services include SMS and mobile Internet data services.

CaTV services: Includes revenues from basic CaTV subscriber service providing transmission improvement and/or added broadcast channels, plus revenues from auxiliary CaTV services (such as pay-TV, security services, or shopping) when provided via a separate CaTV network. This includes revenues from any operator, public or private.

The chart below displays the estimated value of the telecommunications market in the EU25, as depicted above, and the trend since 2000. The inter-annual growth rate is shown in Figure 2.

Figure 1

Figure 2

Figure 3 shows the relative value of the communications market in the New Member States compared to the overall EU25 market value. The overall EU25 market value is estimated to be € 277 billion, with the value of the EU15 estimated at € 256.8 billion and the New Member States € 20.2 billion.

Figure 3

Figure 4 displays the relative value of each of the four market segments (mobile telephony services, fixed voice telephony services and CaTV services) with respect to the total national market. According to these estimates, mobile revenues are the largest contributor to the overall communications market in all Member States and represent more than 50 % of the overall national market in Lithuania, Luxembourg, Czech Republic, Latvia, Slovenia, Italy and Slovakia. Mobile revenues also represent 50% of the average market value of the New Member States.

Figure 4

The following charts show how the mobile, and the fixed data services sectors have become the main drivers of growth in the communications market, while fixed-voice revenues steadily lose ground.

Figure 5

Figure 6

2. PLAYERS IN THE FIXED MARKET

2.1. Players in the fixed market

This section looks at the number of fixed telecommunications operators (fixed voice telephony and network services) in the market. It includes data on the estimated number of operators authorised to operate a network and to provide public fixed voice telephony, the number of players actually active in the market and the incumbents' market shares in the fixed voice telephony market.

Data are provided by the national regulatory authorities and refer to July 2004. The figures include a variety of operators: fixed network operators, service providers, cable operators as well as wireless local loop, and mobile and satellite operators for the fixed part of their networks and services.

Under the new regulatory framework for electronic communications, operators are only subject to a general authorisation regime. Undertakings may be required to submit a notification but may not be required to obtain an explicit decision or any other administrative act. Granting of individual rights of use is required only for scarce resources such as radio spectrum or numbers.

Given the above, the quality of the information provided by the NRAs on the number of operators is variable, and while a number of NRAs are able to provide very detailed information on the number and characteristics of their national operators, other NRAs no longer have precise information. Therefore, the overall figures on the number of operators should be considered as estimates.

There are two major developments in 2004 with respect to previous years. The enlargement of the EU gave rise to a significant increase in the number of operators. This increase (23% in the number of network operators and 28% in the number of voice operators) is considerably higher than the increase in the value of the market as described in the previous section (Figure 3). The second development is the rise in the number of operators at EU15 level (17% in network operators and 3% in voice operators), which means a halt in the downward trend observed since 2001. Although modest in the case of voice providers, this change is in line with the renewed climate of confidence signalled in the Commission Communication.

Among the voice telephony operators in the EU, around half (some 830) actually provide services. In the new Member States (NMS), where the liberalisation process started later than in the EU15, similar patterns can be observed in that new entrants provide services to specific market segments. Again competition in these countries is at an early stage and largely concentrated in the international calls market.

The total number of major competing operators (i.e. operators that along with the incumbent operator have a combined market share of at least 90% of the global telephony market;) in the EU is around 82. Only in 5 Member States there are more than 5 major competing operators (Figure 12).

Figure 7

2.2. Public fixed network operators

The chart below shows the estimated number of network operators authorised to offer network services. *Public network operators* are defined as operators that install, manage and operate a telecommunications transmission network to provide public telephony services or public network services in the whole national territory, whatever the geographical scope of the service.

As at July 2004 there were a total of 2141 authorised network operators in the EU.

Figure 8

Denmark: Due to the fact that in Denmark there is neither a licensing requirement nor a central register of operators, the number of operators authorised to offer public voice telephony has been estimated using the number of allocated access codes. All providers offer nationwide services. Simple resellers are excluded.

Germany: Figures refer only to the operators that received a licence before mid 2003.

Spain: Several operators have been grouped under the AUNA (7) and R brands (2)

Finland: 40 network operators are local incumbents and belong to the Finnet Group. 5 network operators belong to the Elisa Group.

France: Of the 148 operators declared, 109 are in a test phase (especially for WIFI)

2.3. Public fixed voice telephony operators

Public fixed voice telephony is defined as a service available to the public for the direct transport on a commercial basis of real-time speech via the public switched network, such that any user can use equipment connected to a network termination point at a fixed location to communicate with another user of equipment connected to another termination point. Voice telephony could be provided by operators on an own self-operated network or on a leased network. In the first case, the operator provides voice telephony over a network fully controlled, operated and (wholly or partially) owned by it; in the second case the operator operates, controls and manages the transmission capacity leased from another operator. Simple call-back and calling card services as well as operators dealing only with marketing, billing, etc., are excluded. The definition of service provider may differ from that used in the national law of individual countries (in some countries non-self operated network operators engage exclusively in reselling activities).

Figure 9

Denmark: Due to the fact that in Denmark there is neither a licensing requirement nor a central register of operators, the number of operators authorised to offer public voice telephony has been estimated using the number of allocated access codes. All providers offer nationwide services. Simple resellers are excluded.

Germany: Figures refer only to the operators that received a licence before mid 2003.

Spain: Several operators have been grouped under the AUNA (7) and R brands (2)

Finland: 39 operators are local incumbents and belong to the Finnet Group. 5 national operators belong to the Elisa Group.

The number of operators authorized to offer public fixed telecoms services indicates only the potential for competition in the market rather than the actual level of competition. For this reason, where possible, an estimate is given of the number of operators that are active in the market. The following chart shows the estimate of the number of operators active in the voice telephony market at July 2004. Figures do not distinguish between local and national operators.

Figure 10

The chart includes cable TV operators that also provide voice telephone services
 Denmark: Minimum figure based on the number of operators known to the NRA.
 Spain: Several operators have been grouped under the AUNA (7) and R brands (2)
 France: Only those operators that have responded to the ART statistical questionnaire. There are 23 operators providing local calls service (4 local operators and 19 national operators) and 28 operators providing long-distance calls (4 local and 24 national operators)
 Austria: Only operators that gave information on operating revenues for local/national/ international call services
 Poland: data for voice operators refer to 2003
 Sweden: 50 approx. for voice.

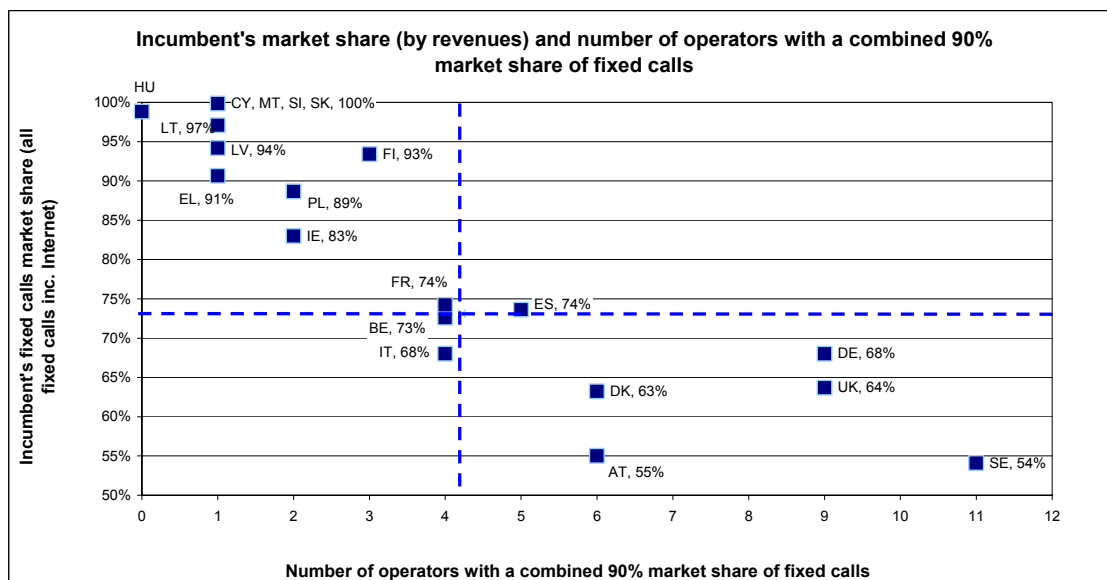

Many new entrants concentrate on specific segments of the market or limit their activity to specific geographic areas, thus having a limited impact on the national market as a whole. To get an idea of the number of fixed operators that are effectively competing with the incumbent at national level, the following charts show, for each country, the number of operators that have a combined market share, based on revenues, of at least 90% on the total voice telephony market including all types of calls (Local calls to internet, local phone calls, long-distance and international calls as well as calls to mobile). Only 5 countries have more than 5 competing operators (including the incumbent) with such a combined market share. These figures give an idea of the number of major players operating in each national market, although in many cases, competition is largely asymmetric, with incumbents continuing to hold a strong position. This situation can be observed in the New Member States, where the fixed incumbent still dominates the fixed voice market.

Figure 11

In Hungary there are 5 fixed incumbent operators, each of them former local monopolies in their primary areas. The level of competition in these 5 fixed traffic markets is not significant yet.

Figure 12

Data for the Netherlands, Luxembourg and Portugal not available.

Data on market shares for Estonia and Czech Republic are confidential.

Belgium: No distinction between local and national calls

Denmark: Market share based on minutes, not on traffic

Slovakia: Only the incumbent operator is actually providing services.

Finland: The 3 incumbent groupings hold 93.4% of voice market

Sweden: Figure includes VoIP players

Hungary: There are 5 fixed incumbent operators, each of them former local monopolies in their primary areas. The level of competition in these 5 fixed traffic markets is not significant yet.

2.4. Incumbents' market share in the fixed voice telephony market

This section shows the incumbents' market share in the fixed voice telephony markets on the basis of both retail revenues and outgoing minutes of traffic. Where possible, figures for local, long-distance, international call, calls to mobile and calls to internet are shown. Not all Member States collect both types of data, and differentiation between the various markets is not always available.

Figures in this section have been provided by NRAs and refer to December 2003, except for United Kingdom (March 2004) and Austria (September 2003).

In Cyprus the situation has changed very rapidly since December 2003 and in September 2004 the incumbent operator had lost 4% in the local/national market and 3% in the market for international calls.

The following chart shows the EU15 weighted average trend for the incumbent's market share in the major segments of the voice telephony market since 2001 based on retail revenues. Data are not comparable with data of previous reports, due to the fact that figures for the years 2000, 2001 and 2002 have been updated to reflect revised data received from several Member States and the EU average is weighted on the national population, while in previous reports a simple average was shown.

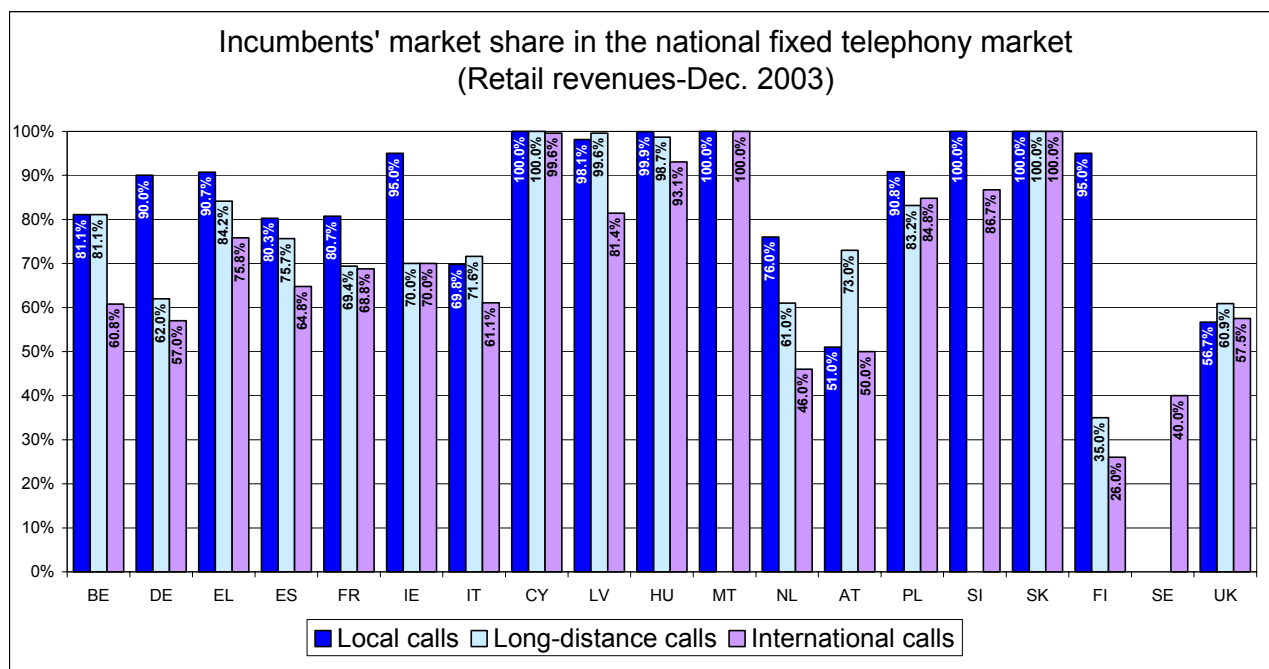

Given that data was not available for all countries and for all types of calls, the average EU data should be considered as indicative. The figure for the local calls market is an average of countries that represent more than 90% of the EU population in 2001, 2002 and 2003; data for calls to mobile represent around 94% of the EU population for the period 2003-2001 and 90% for the year 2000; data for international calls represent more than 96% of the EU population for all the periods considered.

Figure 13

The following two charts show the incumbents' market share in the local, long-distance and international call market by retail revenues and by minutes of outgoing traffic. The local calls market includes both local phone calls and local calls to internet.

Figure 14

Data for local calls include calls to the internet.

Belgium: No distinction between local and national calls

Czech Republic: Confidential data.

Denmark: Figures not available. No distinction between local and long-distance calls

Estonia: Confidential data.

Ireland: Operators classify internet calls differently. They may be included in other call categories such as local only, national as well as internet, therefore market shares are varied.

Italy: Due to a change in the operator basket and in the analytical methodologies, the data are not comparable with data released in 2002, which have been recalculated on the new basis

Lithuania: Only the incumbent's market share on the basis of total revenues from fixed telephony is available

Luxembourg: Data on revenues are not available. Data on traffic is a NRA estimate.

Hungary: VoIP is excluded as an access service, but included when used as a means of transport.

The Netherlands: Figures are indicative.

Austria: Figures refer to September 2003.

Slovenia: No distinction between local and long-distance.

Finland: Figures for local call share is the combined market share of TeliaSonera, Elisa and Finnet. 2002 figure was an estimate. Figures for long-distance and international calls include TeliaSonera only.

Sweden: Detailed data are unavailable. Only a figure for the whole national fixed calls market, including internet, is available (56%).

United Kingdom: Market shares for the quarter to March 2004. Figures have been updated to reflect revised data received from operators

Figure 15

Data for local calls include calls to the internet.

Belgium: No distinction between local and national calls

Czech Republic: Confidential data.

Denmark: Detailed data are unavailable. Only a figure for the whole national fixed calls market, including internet, is available (63.64%). There is no distinction between local and long-distance calls

Estonia: Confidential data.

Ireland: Operators classify internet calls differently. They may be included in other call categories such as local only, national as well as internet, therefore market shares are varied.

Italy: Due to a change in the operator basket and in the analytical methodologies, the data are not comparable with data released in 2002, which have been recalculated on the new basis

Lithuania: Only the incumbent's market share on the basis of total revenues from fixed telephony is available

Luxembourg: Data on revenues are not available. Data on traffic is a NRA estimate. Local phone calls do not exist as a separate category from long-distance calls

Hungary: VoIP is excluded as an access service, but included when used as a means of transport.

The Netherlands: Figures are indicative.

Austria: Figures refer to September 2003.

Portugal: Data on traffic are estimates.

Slovenia: No distinction between local and long-distance.

Finland: Figures for local call share is the combined market share of TeliaSonera, Elisa and Finnet. 2002 figure was an estimate. Figures for long-distance and international calls include TeliaSonera only.

United Kingdom: Market shares for the quarter to March 2004. Figures have been updated to reflect revised data received from operators

The following charts show the incumbents' market share in the local calls market by retail revenues and by minutes of outgoing traffic. Where possible, separate figures for local phone calls and local calls to internet, are provided.

Figure 16

Belgium: No distinction between local and national calls

Czech Republic: Confidential data.

Denmark: Figures not available. No distinction between local and long-distance calls

Estonia: Confidential data.

Ireland: Operators classify internet calls differently. They may be included in other call categories such as local only, national as well as internet, therefore market shares are varied.

Italy: Due to a change in the operator basket and in the analytical methodologies, the data are not comparable with data released in 2002, which have been recalculated on the new basis

Lithuania: Only the incumbent's market share on the basis of total revenues from fixed telephony is available

Luxembourg: Data on revenues are not available. Data on traffic is a NRA estimate.

Hungary: VoIP is excluded as an access service, but included when used as a means of transport.

The Netherlands: Figures are indicative.

Austria: Figures refer to September 2003.

Slovenia: No distinction between local and long-distance.

Finland: Figures for local call share is the combined market share of TeliaSonera, Elisa and Finnet. 2002 figure was an estimate. Figures for long-distance and international calls include TeliaSonera only.

Sweden: Detailed data are unavailable. Only a figure for the whole national fixed calls market, including internet, is available (56%).

United Kingdom: Market shares for the quarter to March 2004. Figures have been updated to reflect revised data received from operators

Figure 17

Belgium: No distinction between local and national calls

Czech Republic: Confidential data.

Denmark: Figures not available. No distinction between calls to internet and local phone calls

Estonia: Confidential data.

Ireland: Operators classify internet calls differently. They may be included in other call categories such as local only, national as well as internet, therefore market shares are varied.

Italy: Due to a change in the operator basket and in the analytical methodologies, the data are not comparable with data released in 2002, which have been recalculated on the new basis

Lithuania: Only the incumbent's market share on the basis of total revenues from fixed telephony is available

Luxembourg: Data on revenues are not available. Data on traffic is a NRA estimate. Local calls do not exist as a separate category from long-distance calls

Hungary: VoIP is excluded as an access service, but included when used as a means of transport.

The Netherlands: Figures are indicative.

Austria: Figures refer to September 2003.

Portugal: Data on traffic are estimates.

Slovenia: No distinction between local and long-distance.

Finland: Figures for local call share is the combined market share of TeliaSonera, Elisa and Finnet. 2002 figure was an estimate. Figures for long-distance and international calls include TeliaSonera only.

United Kingdom: Market shares for the quarter to March 2004. Figures have been updated to reflect revised data received from operators

Figure 18

Market share for all fixed calls including internet, except in Germany and Lithuania, where the figures for market shares based on traffic do not include internet.

Belgium: No distinction between local and national calls

Czech Republic: Confidential data.

Estonia: Confidential data.

Ireland: Operators classify internet calls differently. They may be included in other call categories such as local only, national as well as internet, therefore market shares are varied.

Italy: Due to a change in the operator basket and in the analytical methodologies, the data are not comparable with data released in 2002, which have been recalculated on the new basis

Lithuania: Only the incumbent's market share on the basis of total revenues from fixed telephony is available

Luxembourg: Data on revenues are not available. Data on traffic is a NRA estimate.

Hungary: VoIP is excluded as an access service, but included when used as a means of transport.

The Netherlands: Figures are indicative.

Austria: Figures refer to September 2003.

Portugal: Data on traffic are estimates.

Slovenia: No distinction between local and long-distance.

Finland: Figures for local call share is the combined market share of TeliaSonera, Elisa and Finnet. 2002 figure was an estimate. Figures for long-distance and international calls include TeliaSonera only.

United Kingdom: Market shares for the quarter to March 2004. Figures have been updated to reflect revised data received from operators

Figure 19

Czech Republic: Confidential data.

Denmark: Figures not available

Estonia: Confidential data.

Ireland: Operators classify internet calls differently. They may be included in other call categories such as local only, national as well as internet, therefore market shares are varied.

Italy: Due to a change in the operator basket and in the methodologies of analysis, the data are not comparable with data released in 2002, which have been recalculated on the new basis

Lithuania: Only the incumbent's market share on the basis of total revenues from fixed telephony is available

Luxembourg: Data on revenues are not available. Data on traffic is a NRA estimate.

Hungary: VoIP is excluded as an access service, but included when used as a means of transport.

The Netherlands: Figures are indicative.

Austria: Figures refer to September 2003.

Slovenia: No distinction between local and long-distance.

Finland: Figures for local call share is the combined market share of TeliaSonera, Elisa and Finnet. 2002 figure was an estimate. Figures for long-distance and international calls include TeliaSonera only.

United Kingdom: Market shares for the quarter to March 2004. Figures have been updated to reflect revised data received from operators

2.5. Public ownership of the incumbent operator

The chart below shows the share of public ownership in the incumbent operators. Only in Cyprus and Luxembourg is the incumbent fixed operator fully State owned. In six countries the incumbent is fully privatised (Denmark, Spain, Ireland, Italy, Hungary and the United Kingdom), although in some cases a golden share mechanism exists. In most other countries the State ownership is still significant at around 40%, with 5 countries (Belgium, Czech Republic, Latvia, Malta and Slovenia) where the State owns more than 50% of shares. The most recent sales of State shares took place in Germany and France.

Figure 20

3. CONSUMERS' CHOICE OF FIXED OPERATORS

This section analyses the fixed voice telephony market from the point of view of consumers.

The data presented below have been provided by the national regulatory authorities and, unless otherwise indicated, report the position as at July 2004. Figures for countries not included in the charts are not available. Figures are not always comparable with those published in previous reports due to changes in the methodologies and/or in the classifications used by the Member States. Most Member States have revised their methodologies in 2004 resulting in lower figures than those reported in previous reports for both local calls and long-distance/international calls.

Information on consumers' use of alternative providers is unavailable in the majority of the New Member States.

3.1. Percentage of subscribers actually using an alternative provider other than the incumbent

Incumbents' customers are more and more aware of the possibility of using an alternative provider, either by dialling a call-by-call prefix (*carrier selection*) or by choosing to route all calls by default to the network of an alternative operator (*carrier pre-selection*). The use of an alternative operator through carrier selection/carrier pre-selection does not exclude the possibility of also using the incumbent's services. Direct access is also available to users through alternative operators' proprietary wireline/wireless access or through unbundled local loops leased from the incumbent.

As at July 2004, 31% of EU15 subscribers used an alternative provider to route long-distance and international calls, while only 20% were using alternative providers for local calls. At the same time, direct access from alternative providers was used by 6.5% of EU15 subscribers. Since last year, the percentage of subscribers using an alternative provider has grown by 0.5 percentage points for direct access, 3.5 points for long-distance/international calls and almost 2 points for local calls.

Figure 21

Member States not included in the EU weighted average:

Local: 2004: The Netherlands, Portugal. 2003: Ireland, Italy, the Netherlands, Austria, Portugal. 2002: Ireland, Italy, the Netherlands, Austria, Portugal, France

Long distance/int.: 2004: The Netherlands (data for United Kingdom refer to 2003). 2003: Ireland, the Netherlands, Italy, Austria. 2002: Ireland, the Netherlands, Italy, Austria, Germany, France.

Direct access: 2004: Ireland, the Netherlands. 2003: Ireland, the Netherlands, Austria. 2002: Ireland, the Netherlands, Austria, France, Portugal.

The methodology for the calculation of the percentage of subscribers (residential + business) actually using a provider other than the incumbent operator is the following:

1- LOCAL CALLS: x:y

X = sum of all alternative operators' subscribers (residential + business) with CPS contract + sum of all alternative operators' subscribers (residential + business) with direct access for voice telephony (ULL and proprietary infrastructure)

Y = total number of residential + business subscribers of the incumbent and new entrants, with a standard/party/group telephone lines access. Direct telephone line access provided by an alternative operator can either be through proprietary infrastructure or full ULL .

2-LONG DISTANCE & INTERNATIONAL CALLS: x:y

X = sum of all alternative operators' subscribers (residential + business) with CPS contract + 50% of the sum of all alternative operators' subscribers (residential + business) with CS contract + sum of all alternative operators' subscribers (residential + business) with direct access for voice telephony (ULL and proprietary infrastructure).

Y = total number of residential and business subscribers of the incumbent and new entrants, with a standard/party/group telephone lines access. Direct telephone line access provided by an alternative operator can either be through proprietary infrastructure or full ULL (in the latter case, please consider the number of unbundled active lines, and not the total number of unbundled lines).

3-DIRECT ACCESS

Total number of subscribers with direct access, fully ULL connection or with a cable access owned by an alternative operator

The following charts show the % of subscribers using an alternative provider for voice telephony services through carrier selection, carrier pre-selection and direct access. Where available, separate figures for local and long-distance/international calls are given.

Figure 22

Belgium: Data refer to 31/12/2003.No distinction between local, national and international calls.

Denmark: No distinction between local, national and international calls. Only active subscriptions to CPS in the last 3 months are included with a weighting of 25%. The figure therefore is likely to be underestimated

Greece: Data refer to 31/12/2003.

France: Correction of data for previous reports so as to be comparable with 10th report. Data of 8th report are not comparable to those of 9th and 10th reports,

Italy: Data refer to 31/12/2003. Data are not comparable with that of previous years.

Luxembourg: No distinction local/long-distance/international.

Austria: Estimate for CPS only, no distinction between local/long-distance/international calls.

Portugal: Not available for local calls. Data for 2003 and 2002 have been adjusted following a redefinition of the indicators and a new data collection. Data for 2002 and 2003 are estimated based on the new methodology.

Estonia: No distinction between local and national calls.

Lithuania: Data available for direct access only.

Malta: No alternative operators

Slovenia: Alternative operators started in July 2004 with CPS and CS functionality.

Sweden: Data refer to CPS only by end 2003. No distinction between local and national calls.

United Kingdom: No data for long distance/international calls.

Cyprus, the Netherlands, Czech Republic, Hungary, Latvia, Poland, Slovakia: No data available

Figure 23

Belgium, Greece, Austria, Sweden: Data refer to 31/12/2003.

Denmark: Direct access inc. PSTN, ISDN and ULL.

France: Data of previous reports have been revised so as to be comparable with 10th report. Data of 8th report are not comparable to those of 9th and 10th report,

Italy: Data refer to 31/12/2003. Data are not comparable with that of previous years.

Malta: No alternative operators

Slovenia: Alternative operators started in July 2004.

Ireland, the Netherlands, Cyprus, Czech Republic, Hungary, Latvia, Poland, Slovakia: No data available

3.2. Facilities used by new entrants for the provision of voice telephony

This section provides information on the facilities used by new entrants to offer voice telephony, particularly to residential users.

Data have been provided by the national regulatory authorities and refer to July 2004.

Alternative operators can route users to their network either through a carrier selection system (CS), i.e. user dials a prefix on a call-by-call basis, or by carrier pre-selection (CPS), where the user's calls are routed to the new entrants' network on an automatic basis. New entrants can also provide direct access to users through proprietary wire/wireless access or through unbundled local loops leased from the incumbent.

These facilities are not mutually exclusive and very often the same operator uses the three at the same time depending on the type of customers (business or residential), the type of services (local or long-distance/international calls), the geographical area, the availability of ULL, etc. The following figures should therefore be read separately and not aggregated as country totals.

As at 1 July 2004, 835 operators were effectively providing voice telephone service at EU25 level, of which 518 did so by using carrier selection and 289 by carrier pre-selection. As indicated above, many operators use carrier selection and carrier pre-selection at the same time. This is in line with the figures for previous years. Around 2/3 of the new entrants that are operational in the European market offer voice telephony services through carrier selection and/or carrier pre-selection, and only 1/3 of them use direct access to customers.

The following two charts show the number of operators using carrier selection and/or carrier pre-selection by Member State at July 2004. Where possible, separate figures for types of calls are given; in the other cases separate data were not available or operators do not differentiate the facilities used by type of calls. In a number of countries operators do not differentiate between local and national calls.

The number of operators using carrier selection and/or carrier pre-selection depends on the number of authorised operators, which can vary widely between countries.

For these reasons, an estimate of the number of operators using carrier selection and/or carrier pre-selection as a percentage of authorised operators is also shown. Moreover, the figures do not show to what extent the operators are offering services to residential and/or business users; nation-wide or only in local areas; all types of calls or only local or long-distance or international calls, etc.

In several countries the precise number of operators is unknown. The charts below are based on the estimated number of operators present in each Member State, even when some of these operators are not effectively providing services.

Figure 24

Belgium: Figures refer to national calls only and not to international calls. There is no distinction between local and national calls.

Denmark: Value is a minimum.

Estonia: No distinction between local and national calls.

France: The 11 operators displayed in the chart provide services to residential customers.

Ireland: No distinction between local, long-distance and international calls.

Cyprus: Commercial provision of CS and CPS service started in January 2004.

Latvia: CS is only available for international calls. CS for local and national calls (no distinction) will be available from 1.1.06.

Malta: No alternative operators

The Netherlands: No distinction between local and long distance.

Austria: Data refer to 31/12/2003.

Poland: Figures refer to the number of operators that have access to a network number (NDS) and that are actually offering public voice telephony.

Portugal: There are 9 indirect access operators of which 7 are offering services to residential customers on a call-by-call basis.

Slovakia: CS, CPS and LLU not established yet

United Kingdom: As at 1/4/04.

Czech Republic, Italy, Hungary, Slovenia, Sweden: No data available. CS and CPS are available since 1.1.2004 in Hungary. In Slovenia CS is available since mid 2003 and CPS since January 2004.

Figure 25

Belgium: Figures refer to national calls only and not to international calls. There is no distinction between local and national calls.

Denmark: Value is a minimum.

Estonia: No distinction between local and national calls.

France: The 11 operators displayed in the chart provide services to residential customers.

Ireland: No distinction between local, long-distance and international calls.

Cyprus: Commercial provision of CS and CPS service started in January 2004.

Latvia: CPS is only available for international calls. CPS for local and national calls (no distinction) will be available from 1.7.06.

Malta: No alternative operators

The Netherlands: No distinction between local and long distance.

Austria: Data refer to 31/12/2003.

Poland: Figures refer to the number of operators that have access to a network number (NDS) and that are actually offering public voice telephony.

Portugal: There are 9 indirect access operators of which 7 are offering services to residential customers on a call-by-call basis.

Slovakia: CS, CPS and LLU not established yet.

Sweden: Estimated.

United Kingdom: As at 1/4/04.

Czech Republic, Italy, Hungary, Slovenia: No data available. CS and CPS are available since 1.1.2004 in Hungary. In Slovenia CS is available since mid 2003 and CPS since January 2004.

4. PUBLIC NETWORK INTERCONNECTION

4.1. Fixed-to-fixed interconnection charges

This section analyses the interconnection charges for call termination on the incumbent's fixed network. The figures show charges per minute based on the first three minutes of a call at peak-time, VAT excluded.

The figures may have been approved by the NRA or simply agreed between operators, where the legal framework does not require NRA approval. The following chart shows the EU weighted average for the interconnection charges since 2000 for local level, single and double transit. The exchange rates for 2004 have been applied to the years 2000-2003 for the non euro-zone countries. Since August 2000, the EU weighted average charge for call termination on fixed networks has decreased by 55% for single transit, by 36% at local level, and by 22% for double transit. Major reductions took place between 2000 and 2002 and again during the past 12 months, especially as regards single and double transit, with annual reductions of 6% and 8% respectively. The annual reduction for local level was 5%. Among this generalised downward trend, the major changes since last year have occurred in the United Kingdom (-15%) and Belgium (-12%) for local level termination, Sweden (-25%), Germany (-10%) and Belgium (-10%) for single transit and Greece (-39%), Germany (-18%) and Portugal (-10%) for double transit call termination.

There is a strong correlation between the levels of the charges and the timing of liberalisation of the market. Interconnection charges, for most of the new Member States, are significantly higher than those for EU15 (74% higher for local level, 60% for single transit and 32% for double transit).

Figure 26

The following three charts show the interconnection charges for local level, single and double transit as of 1 July 2004. For the EU15 countries the values of July 2003 are also shown.

Figure 27

Cyprus, Latvia: no distinction between local and long-distance domestic calls.
 Denmark, Sweden, United Kingdom: Figures for 2003 have been recalculated using the 2004 exchange rate.
 Greece: Charges include the signalling and the 2Mbs Ports' cost. The audit for cost orientation for the year 2004 is in progress.
 Finland: The charges of the 46 SMP operators differ. The interconnection price indicated here is based on the price of the two major SMP operators (TeliaSonera and Elisa).
 Italy: Price does not include call set-up
 Luxembourg: Including call set-up (not included in 2003)
 Hungary: Prices refer to the main incumbent operator Matav
 Malta: Only one interconnection level.
 Austria: Charges according to a draft measure

Figure 28

Denmark, Sweden, United Kingdom: Figures for 2003 have been recalculated using the 2004 exchange rate.
 Greece: Charges include the signalling and the 2Mbs Ports' cost. The audit for cost orientation for the year 2004 is in progress.
 Spain: All tariffs are per minute, time counted on a per-second basis. 0,0095 metropolitan traffic; 0,0105 single transit
 Finland: The charges of the 46 SMP operators differ. The interconnection price indicated here is based on the price of the two major SMP operators (TeliaSonera and Elisa).
 Italy: Price does not include call set-up
 Luxembourg: Including call set-up (not included in 2003)
 Hungary: Prices refer to the main incumbent operator Matav
 Malta: Only one interconnection level.
 Austria: Charges according to a draft measure

Figure 29

Denmark, Sweden, United Kingdom: Figures for 2003 have been recalculated using the 2004 exchange rate.

Greece: Charges include the signalling and the 2Mbs Ports' cost. The audit for cost orientation for the year 2004 is in progress.

Finland: The charges of the 46 SMP operators differ. The interconnection price indicated here is based on the price of the two major SMP operators (TeliaSonera and Elisa).

Italy: Price does not include call set-up

Luxembourg: Including call set-up (not included in 2003)

Hungary: Prices refer to the main incumbent operator Matav

Malta: Only one interconnection level.

Austria: Charges according to a draft measure

United Kingdom: Data refer to a connection of more than 200km. For lengths of up to 100km the interconnection charge at double transit is 0.94 euro cents; and for distance between 100 and 200km it is 1.19 euro cents.

4.2. Fixed-to-mobile interconnection charges

This section shows the per-minute interconnection charges for fixed call termination on the networks of mobile operators. Charges for call termination on the networks of 3G operators are not included.

In the following charts information is shown for 75 mobile operators in the EU (representing almost 100% of the EU mobile market). A total of 34 operators in the following EU countries have been designated as having significant market power in the national market for interconnection (SMP): Belgium, Czech Republic, Greece, Spain, France, Ireland, Italy, Cyprus, Latvia,, Hungary, Malta, Poland, Slovenia, Finland, Sweden and the United Kingdom. Given the different status of implementation of the new regulatory framework in each Member State, in some countries SMP is designated under the old framework, while in other countries it is based on the market analysis carried out by the national regulatory authorities. SMP operators cover 62% of the EU mobile market in terms of subscribers.

26 operators have been designated as SMP on the national mobile market (SMP-mobile) in 18 Member States: Belgium, Denmark, Greece, Spain, France, Ireland, Italy, Luxembourg, Portugal, Sweden, Cyprus, Czech Republic, Estonia, Hungary, Malta, Poland, Slovakia and Slovenia. In Germany, the Netherlands, Lithuania and Austria there are no operators designated as SMP or as SMP-mobile.

Charges are for calls originated in the same countries. In Finland there is no fixed-to-mobile termination charges. In the case of a call from a fixed network to a mobile network, local operators determine the local network charges and mobile operators determine the mobile call charges.

The per-minute interconnection fees are based on the first three minutes of a call at peak rate, except for the Netherlands, Ireland and Lithuania where an average peak/off-peak rate is given.

Data have been collected by the NRA, and refer to August 2004. Data for Germany was provided by Cullen International.

Figure 30 shows the national weighted average for SMP and non-SMP operators. The EU25 weighted average of fixed-to-mobile interconnection charges for the 34 European SMP operators in the interconnection market is 13.73 €-cents. For the non-SMP operators the average fee is 16.30. If all mobile operators were considered, the average charge would be 14.70 (Figure 33). Values for each country are weighted average prices based on the number of subscribers and the termination rate of each operator.

Figure 30

Figure 31

The following chart shows the trend in the weighted average fixed-to-mobile interconnection fees for SMP and non SMP mobile operators in the EU15 between July 2001 and July 2004. The 2004 exchange rates have been applied to the non euro-zone countries for previous years. Figures for 2001 for non-SMP operators are not available.

Last year there was a major reduction in the average termination rate for SMP operators only, while the average rate for non-designated operators remained stable. The major development in the last 12 months is that fees cuts have affected both type of operators.

The average termination rate for SMP operators has decreased by 14%, while the reduction for the non SMP operators was 13%.

The increase in the number of SMP designated operators signalled in the last report has continued and. EU15 SMP operators now cover 62% of subscribers, against 45% in 2003 and 41% in 2002.

Despite the continuing decline in the interconnection charges, their level remains on average more than 8 times higher than the average fixed-to-fixed interconnection charges (double transit). Last year termination rates of SMP operators were 9 times higher than the fixed termination rates.

Figure 32

Figure 33 shows the average national mobile termination charge in the EU15 for the last three years. At EU15 level there has been a 22% reduction. The most significant cuts have occurred in the United Kingdom, Sweden, Finland (at the retail level) and the Netherlands. Termination charges have decreased in all Member States except for France, Italy and Luxembourg, where prices have increased, and Germany and Austria, where prices remained stable.

Figure 33

- Figures for Denmark, Sweden and United Kingdom for 2003 have been recalculated using the 2004 exchange rates.

The following charts show the individual fixed-to-mobile interconnection charges for 75 mobile operators in the EU. As can be seen, the inclusion of operators from the new Member States has resulted in a wider array of termination fees than at EU15 level. This has not meant, however, a huge increase in the differential of termination fees. In Cyprus charges are as cheap as 3.1 € cents, whereas the most expensive fee is found in Portugal (31.7 € cents). If these two cases are excluded, the differential of the most expensive termination fee from the cheapest expressed as a percentage of the cheapest fee is 178%. Last year, at EU15 level, this figure was 170%. Apart from Cyprus, the Czech Republic has the cheapest mobile termination rates of the new Member States, while Slovenia has the most expensive.

Figure 34

Legend:

(*) SMP operators in the national interconnection market

(+) SMP operators in the national mobile market

Figure 35

Legend:

(*) SMP operators in the national interconnection market

(+) SMP operators in the national mobile market

Figures for the Netherlands, Ireland and Lithuania are not strictly comparable with the others since they represent an average peak/off-peak rate.

Czech Republic: Prices since 1 April 2004

Germany: Data from Cullen International Cross Country Analysis (June 2004, Table 34, Page 180)

Estonia: 2.75 EEK/min (17.58 €cents) if call volume is 3 or over 3 million minutes per month and 2.85 EEK/min (18.21 €cents) if call volume is less than 3 million minutes per month.

Greece: Minimum duration 30 seconds.

Spain: On 7 October 2004 the NRA approved a new set of interconnection tariffs to be applied since 31 October 2004. (16.06 €cents/min. for Amena, 12.88 €cents/min. for Vodafone and 13.26 €cents/min. for Telefonica).

France: Mainland. Call termination tariffs have decreased by 12.5% (Orange France and SFR) and by 15.6% (Bouygues) on 1 January 2004 in accordance with the ART basket. The price for a 3 minute communication at peak rate shows an artificial 3% increase due to the withdrawal of the free call time (40 seconds) that took place on 1 January 2004.

Ireland: All rates based on average MT tariffs. O2 and Vodafone to implement further reduction in September 04

Italy: TIM has adopted, for termination price, a flat rate (14,95 €cent/m) - no call set up at interconnection. Vodafone has adopted a peak/off peak rate: 17,89 €cent/m peak and 12,13 €cent/m off peak - no call set up at interconnection. WIND has adopted a peak/off peak rate: 23.55 is the peak tariff per minute - no call set-up at interconnection

Hungary: Prices for T-Mobile and Pannon applicable since 15/7/04

Austria: SMP-status according to the old framework

Poland: URTiP decision on SMP designation in the mobile termination market has been appealed by operators.

Finland: There is no fixed to mobile termination charges in Finland. In the case of a call from a fixed network to a mobile network, local operators determine the local network charges and mobile operators determine the mobile call charges. The fixed to mobile call charges in Finland are retail charges, not interconnection charges: retail rate for local access by the local operator and retail rate for the mobile segment of the call by the mobile operator. Both fixed and mobile operators determine the charges for their own segments. Proposed legislation in the Parliament could change the system by introducing regulation on fixed to mobile termination.

Sweden: SMP decision and remedies have not yet entered into force, as they have been challenged before the Administrative Court.

4.3. Leased lines interconnection charges

This section shows the monthly rental and the one-off charges for short-distance leased lines (local ends, excluding VAT), up to 2 and 5 km, provided by the incumbent operator to other interconnected operators.

The distance refers to the radial distance between the customer local end leased line and the point of interconnection.

It should be noted that in some cases data include the handover costs, while in other cases these costs are excluded.

National Regulatory Authorities have provided these figures through the questionnaire for the 10th Implementation Report

Data on one-off connection price are taken from the draft Commission Recommendation of on the provision of leased lines in the European Union.

Figures indicate the position in August 2004.

In Hungary the price of the leased line interconnection in the termination segment is not regulated.

In Finland SMP operator charges differ. Leased line prices are averages based on charges of TeliaSonera, Elisa, Oulun Puhelin, Kkkolan Puhelin and Kymen Puhelin, the latter three operators being part of the Finnet group.

4.3.1. 64 Kbit/s part circuit

Figure 36

Czech Republic: Individual price

Latvia: IC circuits not offered

Lithuania: The price does not depend on the length of the line

The Netherlands: Data for local access is not available. The price for a regional service (~25 Km) is € 140.

Slovakia: 64 Kb/s IC circuits not available

Cyprus, Hungary, Malta, Poland: Data not available

Figure 37

Denmark: Weighted average of the one-off connection costs

Slovakia: 64 Kb/s IC circuits not available

Cyprus, Lithuania, Hungary, Malta, Poland: No data available

4.3.2. 2 Mbit/s part circuit

Figure 38

Hungary, Malta: Data not available

Latvia: IC circuits not offered

Lithuania: The price does not depend on the length of the line

The Netherlands: Price per local access (not per Km)

Figure 39

Denmark: Weighted average of the one-off connection costs

Latvia: IC circuits not offered

Cyprus, Lithuania, Hungary, Malta, Poland, Slovakia: Data not available

4.3.3. 34 Mbit/s part circuit

Figure 40

Czech Republic: Individual price

Latvia: IC circuits not offered

The Netherlands: Price excluding (local) fibre access. Fibre access charge is not regulated. Price in the Netherlands is an average of 2 times 34 Mbit/s in a 155 Mbit/s fibre access service and a 155 Mbit/s broadband access group.

Hungary, Malta, Poland: Data not available

Slovakia: 34 Mb/s IC circuits not available

There is no 34 Mbit/s standard price offer in France

Figure 41

Denmark: Weighted average of the one-off connection costs

There is no 34 Mbit/s standard price offer in France

Price in the Netherlands is an average of 2 times 34 Mbit/s in a 155 Mbit/s fibre access service and a 155 Mbit/s broadband access group.

Czech Republic, Cyprus, Lithuania, Hungary, Malta, Poland: Data not available

5. MOBILE MARKET

5.1. 2G mobile penetration

This section provides information on the number of mobile subscribers and the penetration rate for second generation mobile services (DCS-GSM) in each Member State. The growth in the penetration rate since August 2003 for the EU15 countries and December 2003 for the New Member States is also shown.

Figures have been provided by the NRAs and by European Mobile Communications Report. The reference data, unless otherwise stated, is end of June 2004. Where available, data have been provided by the National Regulatory Authorities (NRAs). For those countries where NRAs did not have up to date information, figures are estimated from the “European Mobile Communications” database.

The EU average is a weighted average.

It should be noted that operators and regulators use different methods to count the number of subscribers. Some operators consider the total number of users that have made or received a call or sent an SMS in the last 9 or 6 months, whereas others only consider the active users of the last 3 months. This has an impact in the penetration rate, especially in small countries.

The table below indicates the source of the data and, where available, the definition of ‘active subscriber’ used in every Member State.

Country	Source of data & reference date	Comments
Belgium	EMC estimates June 2004	IBPT data refer to active users in the last 6 months
Czech Republic	NRA 30/6/04	Data for active users in the past 6 months.
Denmark	NRA 30/6/04	Data for active users in the past 3 months.
Germany	NRA 30/6/04	
Estonia	NRA 30/6/04	
Greece	NRA 30/6/04	Breakdown by operator confidential
Spain	Ministry 30/6/04	Definition of active user varies between 13 and 6 months.
France	NRA 30/6/04	Data for active users in the past 3 months.
Ireland	NRA 30/6/04	
Italy	EMC estimates June 2004	Data for active users in the past 3 months.
Cyprus	NRA 30/6/04	Data for active users in the past 3 months.
Latvia	NRA 30/6/04	Data for active users in the past 3 months.
Lithuania	NRA 30/6/04	Data for all cards.

Country	Source of data & reference date	Comments
Luxembourg	EC services1/5/04	
Hungary	NRA 30/6/04	Data for active cards.
Malta	NRA 30/6/04	Data for active users in the past 3 months.
The Netherlands	EMC estimates June 2004	
Austria	EMC estimates June 2004	
Poland	EMC estimates June 2004	
Portugal	NRA 30/6/04	Active users in the last 3 months
Slovenia	NRA 30/6/04	
Slovakia	EMC estimates June 2004	
Finland	NRA 30/6/04	
Sweden	NRA 30/6/04	Data for active users in the past 12 months and 6 months.
United Kingdom	EMC estimates June 2004	

The following chart shows the absolute number of mobile subscribers in each Member State (columns) and the penetration rate (dots), measured as the number of subscribers per 100 population.

Figures for Czech Republic, Spain, Italy, Poland, Slovakia, Slovenia and Sweden include analogue subscribers.

Figure 42

Denmark: Figures include pre-paid cards that have been active within the last 3 months. Inactive pre-paid cards are excluded.

Luxembourg: The penetration rate has been calculated on the basis of the national population only. If trans-national commuters were considered the penetration rate would be around 98%.

Cyprus: A second operator has recently started offering services. The number of subscribers in September has increased to 325 737 and the penetration rate is 89%.

Latvia: The number of subscribers in September has increased to 1 470 885 and the penetration rate is 62.7%.

Lithuania: Figures include all SIM cards. The number of active subscribers in the last 3 months is 2.58 million at the end of June and the corresponding penetration rate would be 74.5%.

Hungary: Data refer to all active cards. The number of active cards in the last 3 months was 7554000 million, i.e. a penetration rate of 74%.

The following chart shows the number of subscribers and the split between post-paid and pre-paid subscribers.

Figure 43

The breakdown of pre-paid/post-paid in Spain is an estimate based on EMC data.
 Denmark: Figures include pre-paid cards that have been active within the last 3 months. Inactive pre-paid cards are excluded

Figure 44

Denmark: Figures include pre-paid cards that have been active within the last 3 months. Inactive pre-paid cards are excluded.

Luxembourg: The penetration rate has been calculated on the basis of the national population only. If trans-national commuters were considered the penetration rate would be around 98%.

Cyprus: A second operator has recently started offering services. The number of subscribers in September has increased to 325 737 and the penetration rate is 89%.

Latvia: The number of subscribers in September has increased to 1 470 885 and the penetration rate is 62.7%.

Hungary: Data refer to all active cards. The number of active cards in the last 3 months was 7554000 million, i.e. a penetration rate of 74%.

Lithuania: Figures include all SIM cards. The number of active subscribers in the last 3 months is 2.58 million at the end of June and the corresponding penetration rate is 74.5%.

Figure 45 displays the growth in mobile penetration expressed in percentage points. Data refer to June 2004 for all Member States, August 2003 for the EU15 countries (Source : 9th Implementation report and NRAs) and June 2003 for the new Member States (Source : 4th IBM Report on Monitoring of EU Candidate Countries (Telecommunications Services Sector)).

Figure 45

Denmark penetration figures are not directly comparable due to a change in the definition of active pre-paid cards. The figure for 30/6/03 includes pre-paid cards that have been active within the past 6 months, while the figure for 30/6/04 includes pre-paid cards that have been active within the past 3 months.

Luxembourg: The penetration rate has been calculated on the basis of the national population only. If trans-national commuters were considered the penetration rate would be around 98% in 2004 and 92% in 2003.

Cyprus: A second operator has recently started offering services. The number of subscribers in September has increased to 325 737 and the penetration rate is 89%.

Latvia: The number of subscribers in September has increased to 1 470 885 and the penetration rate is 62.7%.

Lithuania: Figures include all SIM cards. The number of active subscribers in the last 3 months is 2.58 million at the end of June and the corresponding penetration rate is 74.5%.

Hungary: Data refer to all active cards. The number of active cards in the last 3 months was 7554000 million, i.e. a penetration rate of 74%.

Figure 46

Figure 47

EU average is a weighted average.

5.2. Players in the mobile market

This section shows the number of mobile licences granted in each Member State for the provision of analogue, GSM 900, DCS 1800 and UMTS services.

The data on the number of licensed operators have been provided by the national regulatory authorities and indicate the position in July 2004.

The following chart shows the number of operators licensed to provide digital mobile services (second-generation). The number of operators indicates the real magnitude of the choice of operators for customers of digital mobile services, since very often operators have licences for both GSM 900 and DCS 1800. Mobile network operators have been identified as having only GSM 900 or only DCS 1800 frequencies, or both (in which case they have usually been granted a GSM 900 licence which has subsequently been extended to the DCS 1800 band).

Information on mobile service providers has been included where available (without distinction between local and national coverage). Mobile service providers are defined as entities authorised to offer mobile service under their own brand name (dealing with marketing, billing, etc.), using a third party's mobile network. There are 3 analogue licences for mobile services still active in EU: in Spain, Italy and Sweden. These are scheduled to be phased-out on the 1st January 2007 for Sweden and Spain and at the end of 2005 for Italy.

Figure 48

- Figures for Finland do not include 1 local GSM operator belonging to the Finnet Group (Alands).

- In France there are 3 mobile operators and 1 MVNO offering services in the metropolis territory. The figure does not include 11 operators in the overseas departments (Département de la Réunion, Antilles Françaises, Guyane; Île de Saint Martin et Saint Barthélemy).

5.3. 3G players

This section shows the number of mobile licences granted in each Member State for the provision of UMTS services

The great majority of licences have been granted to players active in the second generation market, and 14 licences have been granted to new entrants. In the New Member States some countries have not yet awarded the 3G licenses.

In 2003, 3G services were available in Italy, United Kingdom, Austria and Sweden. 2004 has witnessed the launch of 3G services in more countries, mostly in the second half of the year. Many of these launches are tests or pre-commercial, and are being used by 3G operators as a way to prepare for the actual commercial launch.

In most cases 3G networks have limited coverage, mostly concentrated in the largest cities, and population coverage ranges from around 80% in the United Kingdom and Sweden to less than 10% in those countries where services started to be offered at the end of year.

In many cases data-cards for laptops and handsets are available, although the offer of data cards exceeds that of handsets.

Figure 49

Figure 50 shows the status of the launch of 3G services (trial and commercial). The following categories are presented:

- Trial: Tests with a closed group of selected users
- Commercial-trial: Trials open to any users with special price packages.
- Commercial: Fully commercial services open to any users at standard tariffs.

Services can be provided by means of data-cards or handsets or both together.

Figure 50

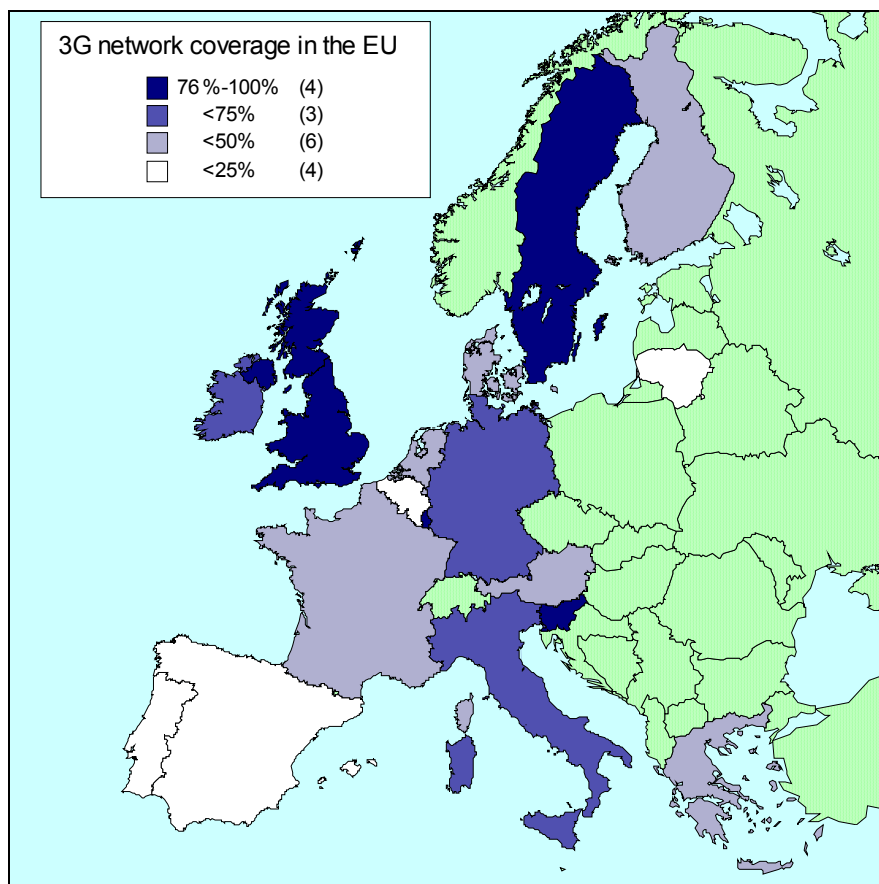

Figure 51

Values indicate the maximum expected coverage announced by any national operator at the end of each year unless otherwise stated. Network coverage by other operators may differ.
Belgium, the Netherlands and Portugal: Source EC

5.4. 2G operators' market shares

The following charts show the market shares based on subscribers of the leading operator and the main competitors in the second generation mobile market.

Operators' market shares have been calculated for the overall mobile market (including analogue, DCS 1800 and GSM 900 subscribers). There are analogue subscribers in Italy, Poland, Slovenia, Slovakia and Sweden.

Data concerning market shares are based on the data supplied by the NRAs. When these data are confidential or not available, estimates on the number of mobile subscribers from the European Mobile Communications database are presented. Data refer to end of June 2004.

In a few countries there exist discount mobile operators which are partially or fully owned by other mobile operators. Mobile customers that have signed-up with these discount operators have been considered separately.

With the exception of Ireland, Luxembourg, the United Kingdom, Hungary, Latvia, Lithuania, Malta, Poland and Slovakia, the leading operator is a subsidiary of the incumbent fixed network operator. Figure 52 shows the shares of the leading operator, the main competitor and the other competitors in the digital mobile market only.

Figure 52

Denmark: Users of the discount operator controlled by the mobile subsidiary of the incumbent fixed operator represent 10% of the market.

Luxembourg: Users of the discount operator controlled by the mobile subsidiary of the incumbent fixed operator represent 22% of the market.

The following chart shows the market share, in terms of subscribers, held by the mobile subsidiary of the incumbent fixed operator. Where the incumbent still operates an analogue service, the shares of the overall mobile market of their analogue and digital services are indicated separately. In the United Kingdom, Ireland, Latvia and Lithuania the fixed incumbent operator does not have a mobile subsidiary. As stated above, users of discount mobile operators controlled by the mobile subsidiaries of the incumbent fixed operators have not been included in the chart below.

Figure 53

Denmark: Users of the discount operator controlled by the mobile subsidiary of the incumbent fixed operator represent 10% of the market.
 Luxembourg: Users of the discount operator controlled by the mobile subsidiary of the incumbent fixed operator represent 22% of the market.

Competition in the mobile sector is intensifying. Figure 54 shows that the average market share of leading operators, based on subscribers in the EU15 Member States, has dropped from 46.58% last year to 43.21% this year. This trend had begun at the end of 2000 however this year’s reduction is greater than the reduction seen in the previous three years combined.

Figure 54

5.5. Mobile basket

The analysis of national (as opposed to roaming) mobile services is based on the OECD baskets for digital mobile services. Due to significant changes in usage patterns, the OECD baskets have been redefined with effect from August 2002. The new baskets are not comparable with the “old” ones, in that they contain an SMS element, they include calls to several mobile networks, and they do not cover international calls.

The new revised baskets are used in this analysis. There are 3 different baskets, based on low, medium and high usage levels. All packages analysed in this study are Post-Paid packages. Some of the main properties of the new OECD baskets are:

- Low usage basket with:
25 outgoing calls per month + 30 SMS messages
42% of calls are to fixed line phones, 58% to mobile phones
- Medium usage basket with:
75 outgoing calls per month + 35 SMS messages
36% of calls are to fixed line phones, 64% to mobile phones
- High usage basket with:
150 outgoing calls per month + 42 SMS messages
40% of calls are to fixed line phones, 60% to mobile phones

Each basket also has a unique definition of time of day distribution and call duration, and includes the monthly rental, and any registration charges distributed over 3 years.

The two most prominent operators in each country are covered, based on available subscriber numbers. All relevant packages from each operator are considered, but the final results presented here only show the cheapest package for each basket.

The asterisk (*) behind the package name means that the package name and its structure have changed between 2003 and 2004. The package chosen at any time is the cheapest package from that provider for the usage profile in question. This may give rise to significant price changes over time.

The balance of fixed and usage in the mobile baskets varies considerably between countries, as the preferred packages in some countries contain a lot of calling time included in the fixed charge.

A full description of the methodology can be found at the end of this report.

Figure 55

Entries with an asterisk (*) after the name have changed the package name and structure since last year.

Figure 56

Entries with an asterisk (*) after the name have changed the package name and structure since last year.

Figure 57

Entries with an asterisk (*) after the name have changed the package name and structure since last year.

6. NUMBER PORTABILITY

6.1. Fixed number portability

Fixed number portability (FNP) enables subscribers to retain their number when they move from one operator to another. Although it was slow to take off, there has been major increase in numbers ported during this year suggesting a more competitive environment where customers are changing operator in greater numbers. Almost 5 million numbers have now been ported in the EU. This is a 61% increase on the previous year. Spain, the Netherlands and Italy show the highest values in absolute terms.

Prices for fixed number portability refer to the amount charged by the incumbent to the recipient operators for porting a telephone number. This price may vary depending on a number of factors.

Figure 58

Belgium: Figures refer to July 2004 and include non-geographical numbers. Price refers to a simple installation. For a complex installation there is a € 89.7 one-off fee.

Denmark: Figures include non-geographic numbers.

Czech Republic, Germany, Greece, Cyprus, Lithuania and Slovenia: Data not available.

Estonia, Hungary, and Lithuania: Number portability was introduced on 1 January 2004.

Greece: No data available

Spain, Portugal: Data refer to end June 2004

Latvia, Malta, Poland and Slovakia: Fixed number portability not available

Finland: Prices vary according to each operator

Sweden: Number of transactions. The exact amount of ported numbers is not available.

United Kingdom: NRA estimates.

6.2. Mobile number portability

Mobile number portability (MNP) only became compulsory in the EU with the entry into force of the new regulatory framework on 25 July 2003. However, many Member States had already introduced MNP in advance to develop competition on the mobile market. Mobile number portability (MNP) allows subscribers to retain their number when they move from one operator to another. The number of ported numbers has increased significantly during the year, with dramatic increases occurring in some countries, namely Belgium, Denmark, Germany, Spain, Ireland, Italy, the Netherlands, Finland, Sweden and the United Kingdom. Overall, 12.1 million numbers have now been ported in the EU, representing 3.2% of mobile numbers. This is a 119% increase on the previous year.

Figure 59

Belgium: Figures refer to July 2004. Price refers to a simple installation. For a complex installation there is a € 23.41 one-off fee.

Denmark: Numbers that have been ported repetitively are counted several times.

Germany: Data refer to 1 June 2004

Spain: Data refer to end of June 2004

Ireland: Price for number portability is being reviewed

Luxembourg, Austria, Slovenia: Data not available. MNP is applied since November 2004 in Luxembourg and since 16 October in Austria.

Czech Republic, Estonia, Latvia, Malta, Poland and Slovakia: Mobile number portability unavailable

Hungary, United Kingdom: Price is subject to commercial negotiation

Finland: Price shown is an average

The following table provides information on fixed and mobile number portability in the Member States. Fixed number portability is not yet available in Latvia, Malta, Poland and Slovakia. Mobile number portability is unavailable in Czech Republic, Estonia, Latvia, Malta, Poland and Slovakia.

	Date of introduction of fixed number portability	Date of introduction of mobile number portability	Comments fixed	Comments mobile
Belgium	1 January 2000	1 October 2003	Situation on 1st July 2004. Includes non-geographical numbers.	
Czech Republic	1 January 2003	Not available		Mobile number portability shall be introduced 6 months after the Law on Electronic Communications will come into effect
Denmark	15 October 1999	1 January 2001	Includes non-geographic numbers. Numbers that have been ported repetitively are counted several times in this figure.	Numbers that have been ported repeatedly are counted several times in this figure.
Germany	1 January 1998	1 November 2002	No data available	Situation as at 1 June 2004
Estonia	1 January 2004	1 January 2005	The service was implemented on 01.01.2004 and, according to the regulation nr. 64 §151 (5), donor operators who owns a technical licence for the use of numbering series have a right to require a fee for ported number from a recipient operator, which shall not exceed 1,5 times a state fee rate per year	The service provision will start at 1 January 2005
Greece	1 January 2003	1 March 2004	From 1/6/2004 a Centralised National Reference Database is used for FNP. One-off charge per application for numbers ported successfully -There is also a fee for each rejected application (2.75)	A Centralised National Reference Database is used for MNP. One off charge per application for numbers ported successfully -There is also a fee for each rejected application (4.8)
Spain	1 January 2000	1 December 2000	As at 25 June 2004	As at 25 June 2004
France	1998 (Sep. 2001 for non-	1 June 2003		

	Date of introduction of fixed number portability	Date of introduction of mobile number portability	Comments fixed	Comments mobile
	geographic numbers)			
Ireland	1 November 2000	1 July 2003	Per single CLI. One-off fee. Rate falls to €3.96 per CLI for orders with 100+CLIs	Interim charge - to be reviewed.
Italy	1 January 2000	30 April 2002	In the case of incumbent acting as donor/donating	Price applicable to all mobile operators acting as donor/donating
Cyprus	12 July 2004	12 July 2004		
Latvia	Not available	Not available	Planned to be available in December 2005	Planned to be available in December 2005
Lithuania	1 January 2004	1 January 2004		
Luxembourg				Planned to be available in November 2004
Hungary	1 January 2004	1 May 2004		
Malta	Not available	Not available	The legal obligation to have fixed number portability has been in force since 1 July 2002. However, currently there is only one fixed operator in the market.	
The Netherlands	1 January 1999	1 January 1999	Current total from 1/1/2001 until July 2004 (latest figures). Service numbers are portable, however in general service numbers are allocated to end-users. The low number (unknown) of actual ported service numbers has been aggregated in the amount of fixed numbers	Current total from 1/1/1999 onwards is unknown.????? Current total from 1/1/2001 until July 2004 (latest figures).
Austria	27 March 2000	30 July 2004		
Poland	1 September 2004			MNP should have started in September 2004 (New telecommunications law regulating this issue will enter

	Date of introduction of fixed number portability	Date of introduction of mobile number portability	Comments fixed	Comments mobile
				into force in Sept. 2004)
Portugal	30 June 2001	1 January 2002	As at end July 2004	
Slovenia		1 May 2004	There are no actual offering of voice telephony from alternative operators	
Slovakia	1 January 2004 (Planned)	1 January 2004 (Planned)	Not yet implemented	Not yet implemented
Finland		25 July 2003	(Business) customers can connect to several operators' networks and direct their outgoing and incoming traffic through different operators. Prices vary greatly. Sonera charges 15 and Elisa 29 euro/order + 9 euro/number (on-off fees).	One-off fee, average
Sweden	1 July 1999	1 September 2001	Number of transactions. Amount of ported numbers not available	
United Kingdom	1 January 1996	1 January 1999	Estimated. One-off charge for simple (not multi-line) ports. Providers set their own charges and these must be reasonable and cost oriented.	Until April 2004. The United Kingdom has no "incumbent" mobile operator. A small number of service providers charge customers about €30 to port. Providers set their own charges and these must be reasonable and cost oriented.

7. BROADBAND ACCESS AND PRICING

7.1. Broadband access

This section provides data on the number and type of broadband lines supplied by both incumbent operators and new entrants in the EU. It also contains information on access lines provided by means of alternative technologies such as wireless access (WLL), satellite and cable modems.

Information has been provided by the national regulatory authorities through the ONP COM02-18 questionnaire on data for local broadband access. Given the rapid developments in this sector, it has been agreed with NRAs to update the ONP questionnaire on a regular basis in January, July and October. Unless otherwise stated, the data below refer to the position at 1 July 2004.

The definitions used in the charts and data below are as follows: :

- Fully unbundled lines: Fully unbundled lines supplied to other operators, excluding experimental lines. In the case of full unbundling, a copper pair is rented to a third party for its exclusive use. As fully unbundled lines (ULL) supplied by the incumbent operator to the new entrants could in principle be used for services other than broadband, the total number of ULL for access to internet will be lower than the total number of ULL.
- Shared access lines supplied by the incumbent to new entrants: Shared access lines supplied to other operators, excluding experimental lines. In the case of shared access, the incumbent continues to provide telephony service, while the new entrant delivers high-speed data services over that same local loop.
- Bitstream access: Supplied to new entrants. Bitstream access refers to the situation where the incumbent installs a high-speed access link to the customer premises and then makes this access link available to third parties, to enable them to provide high-speed services to customers. Bitstream depends in part on the PSTN and may include other networks such as the ATM network. Bitstream access is a wholesale product that consists of the provision of transmission capacity in such a way as to allow new entrants to offer their own, value-added services to their clients. The incumbent may also provide transmission services to its competitor, to carry traffic to a 'higher' level in the network hierarchy where new entrants may already have a broadband point of presence.
- Simple resale: In contrast to bitstream access, simple resale occurs where the new entrant receives and sells on to end users - with no possibility of value added features to the DSL part of the service - a product that is commercially similar to the DSL product provided by the incumbent to its own retail customers, irrespective of the ISP service that may be packaged with it. Resale offers are not a substitute for bitstream access because they do not allow new entrants to differentiate their services from those of the incumbent (i.e. where the new entrant simply resells the end-to-end service provided to him by the incumbent on a wholesale basis).
- Incumbent's DSL lines: Provided to end users by the incumbent, its subsidiaries or partners (for example an associated company such as a joint venture providing ISP services),

- WLL: Internet broadband connections by means of wireless local loop (sometimes referred to as fixed wireless access)
- Cable modem: Internet broadband connections by means of cable TV access
- L.L.: Internet broadband connections by means of dedicated capacity (Leased Lines) provided over metallic copper pairs, including tail ends or partial circuits. “Incumbent's leased lines” includes only retail lines and excludes lines provided to other operators. “New entrants' leased lines” includes all retail lines provided to end users, even if based on wholesale lines supplied by the incumbent.
- Other: Internet broadband connections by means of 3G, satellite, fibre optic, powerline communications, etc.
- Retail access: Access provided to end users.
- Incumbents are defined as the organisations enjoying special and exclusive rights or de facto monopoly for provision of voice telephony services before liberalisation, regardless of the role played in the provision of access by means of technologies alternative to the PSTN.
- “New entrants” refers to alternative telecommunications operators, as well as internet service providers (ISPs).
- Broadband capacity: Capacity equal to, or higher than, 144 Kbit/s

7.2. Wholesale access

This section shows the availability of wholesale access lines supplied by incumbent operators to new entrants. Separate figures are provided for fully unbundled lines, shared access and bitstream access.

Data from the New Member States are included when available. As can be seen from the table at the end of this section, data are not always available, especially as regards wholesale lines. Fully unbundled and shared lines are not available in Cyprus, Malta, Poland and Slovakia. Shared access lines are not available in Estonia. In the figures below for wholesale lines, some operators have also included the lines that the wholesale division supplies to its retail division or to its ISP subsidiary.

In Belgium and Austria, the wholesale lines supplied to the incumbent’s retail division are not included.

The table below shows the number of agreements between operators for ULL, shared access, bitstream and resale as at 1 July 2002, 2003 & 2004.

Table 1 Number of agreements for full ULL, shared access, bitstream access and resale, 2002-2004.

	N. of agreements on fully unbundled lines			N. of agreements on shared lines			N. of agreements on Bitstream access			N. agreements on resale lines		
	July 2002	July 2003	July 2004	July 2002	July 2003	July 2004	July 2002	July 2003	July 2004	July 2002	July 2003	July 2004

SK												
FI	180	n.a.	n.a.	80	n.a.	n.a.	60	n.a.	n.a.	35	n.a.	n.a.
SE	33	63	110	33	63	110	4	23	26	5	11	n.a.
UK	53	57	59	5	7	12	309	n.a.	28	0	535	763
EU	455	307	385	158	122	209	504	165	389	110	588	821

Figure 60 shows the distribution of wholesale access lines supplied by the incumbent operators to new entrants. There has been a huge surge of 110% in wholesale unbundled local loops (fully unbundled lines and shared access lines), from 1.8 million in July 2003 to more than 3.8 million, in July 2004, representing almost 2% of the PSTN lines in the EU15. This increase comprises approximately one million fully unbundled lines and one million shared access lines. The number of shared access lines increased from 191 500 to 1 168 828 lines, an increase of 505%. The biggest increases were experienced in France and Sweden (shared access) and Italy, Germany, Austria and Finland (fully unbundled). It should be noted that, in the two countries where the number of fully unbundled lines is highest, Germany and Italy, only 36% (Germany) and 42% (Italy) of the fully unbundled lines are used for the provision of retail broadband services. The growth of 237% in wholesale bitstream access during the year is also notable, from 795 071 lines in July 2003 to 2 681 398 lines in July 2004.

Figure 60

Figure 61

Figure 62

Figure 63

Including lines sold to the incumbents' retail divisions and ISPs

France: In March 2004 a wholesale offer for broadband at regional level was introduced (IP ADSL regional Option 5). 44% of IP ADSL lines have been migrated to this offer, which explains the huge increase.

7.3. Retail broadband access

This section provides information on the deployment of broadband access lines by incumbents (and their subsidiaries or partners) and by new entrants (alternative telecom operators or Internet Service Providers) to end-users.

Internet broadband access can be provided by different means: DSL lines, wireless local loop (WLL), cable TV access (cable modem), dedicated leased lines and other access (like satellite, fibre optic, powerline communications, etc.)

New entrants’ DSL lines can be provided to end users by means of fully unbundled or shared access lines, bitstream access or resale.

In all the charts below on fixed broadband retail lines the data refer to 1 July 2004 except for Hungary, where data refer to end of March 2004. The figures for Poland do not include cable modem lines.

The charts below only include fixed broadband lines. Data on 3G mobile subscribers are also available in the table at the end of this section.

Figure 64 shows the total number of broadband access lines for each Member State, provided by both incumbents and new entrants, and including all types of fixed broadband connections.

Figure 64

The following chart presents the number of broadband lines per Member State in July 2002, July 2003 and July 2004. France has experienced the largest growth in absolute figures, adding 2.5 million broadband lines during the year, followed by the United Kingdom (2.2 million) and Italy (2 million).

Figure 65

The chart above only includes fixed lines. 3G subscribers in Italy, United Kingdom, Sweden, Austria, as well as in other Member States are not included (see mobile telephony section)

The following two charts show the breakdown of broadband lines according to the two main types of technologies. Figure 66 shows the number of DSL lines. Germany has the highest number of lines, followed by France, Italy and the United Kingdom. Again the highest growth in absolute figures has occurred in France, with 2.4 million lines. In Italy 1.9 million lines were added. With regard to the number of million of broadband lines using transmission means other than DSL (Figure 67), the United Kingdom, the Netherlands and Spain account for 50% of the existing 6.6 million lines. There are 1.6 million in the United Kingdom, almost 1 million in the Netherlands and around 0.7 million in Spain. The biggest increases were experienced in the United Kingdom (0.5 million) and Spain (0.2 million). Cable modem is the most common technology, followed by fibre to the home. Other technologies are still marginal.

Figure 66

Figure 67

The chart above only includes fixed lines. 3G subscribers in Italy, United Kingdom, Sweden, Austria, as well as in other Member States are not included (see mobile telephony section)
Data on cable modem in Poland unavailable.

The following charts provide information on the national broadband markets according to the technology used and the type of operator. Figure 68 shows that DSL is the predominant technology in the EU. On average, 78% of the EU25 broadband lines use DSL technologies and, only in three countries, do DSL lines represent less than 50% of the overall market.

Figure 68

The chart above only includes fixed lines. 3G subscribers in Italy, United Kingdom, Sweden, Austria, as well as in other Member States are not included (see mobile telephony section)

With regard to the market share of fixed incumbent operators and new entrants, Figure 69 indicates that, on average, incumbent operators control 56% of broadband lines. There are significant differences between Member States: In Germany the incumbent owns 87% of the lines, whereas in the United Kingdom this figure is as low as 25%.

Figure 69

Figure 70 presents the market share by operator in the DSL retail market. At EU25 level the fixed incumbent operator provides 70% of DSL lines. In 11 Member States the incumbent operator sells more than 80% of all DSL retail lines.

Figure 70

The next series of charts provide further information on the trends observed in the three segments analysed previously. As can be see from Figure 71, new entrants are steadily increasing their presence in the overall broadband market, with an average 43.6% market share against 41.3% a year ago. This trend is however not uniform, and in countries such as Greece, Ireland, Italy, the Netherlands and Portugal the fixed incumbent operator has increased its market share.

Figure 71

With regard to the trend in the number of DSL lines sold by incumbent operators in the same period, there has been a reduction of 8 percentage points on average, from 78% in July 2003 to 70% in July 2004. With the exception of Greece, Italy and Portugal, incumbent operators have lost market share in all other Member States. The most significant reductions occurred in France, the United Kingdom, Luxembourg and Sweden.

Figure 72

As can be seen from Chart 74 the number of DSL lines has increased in the overall broadband retail market, representing 78% of all broadband lines as against 73% in July 2003. The only exceptions to this general trend are Denmark and Finland.

Figure 73

The following chart shows the penetration rate for broadband lines measured as the total number of broadband lines divided by the total population. The broadband penetration rate varies significantly across Member States ranging from 0.2% in Greece to 15.6% in Denmark. The rate of broadband growth over the year for the EU15 Member States is also diverse, ranging from 0.22 percentage points in Greece to 5.21 percentage points in Denmark. In general, the best performing countries continue to have high rates of growth, widening the gap between them and the countries with lowest penetration levels.

Figure 74

Chart 76 displays the number of DSL lines per 100 PSTN lines of the fixed incumbent operator. There has been an increase of almost 9 percentage points in the Netherlands and of more than 8 points in Denmark, followed by Italy and France with a 7 point increase each.

Figure 75

Malta: On 15/10/04 ISPs decided to double the speed of the connections below 144KB/s, which are not included in this table. As a result of this upgrading there are now about 30,000 broadband lines, out of which, 13,500 are by means of cable modem.

Data for Hungary refer to the first quarter of 2004.

The number of lines in the Czech Republic is understated since it refers to lines above 264 Kbit/s only and the number of users of WLL and LANs/WANs is not included

Data for Poland do not include cable modem lines.

7.4. Prices for unbundled local loop

This section shows the charges for connection and the monthly rental per unbundled loop for both full unbundled access and shared access to the loop.

Estimates of the total average monthly cost are calculated on the basis of the price of the monthly rental + 1/12 of the connection fee.

Price excludes co-location costs.

It is assumed that the loop is active and will be used to provide DSL services.

Charges in some Member States are different in the case of subsequent access.

7.4.1. Prices for full unbundled local loop

LLU is not available in Malta, Poland and Slovakia.

Belgium: Monthly rental for a Type 2 connection, i.e. Type 1 usage + HF data: ADSL, SDSL, xDSL. Connection fee: Type 1 "active loop". For a non-active loop the connection fee is 60.41. A supplementary fee of 16.30 for disconnection is also charged.

Czech Republic: Price in the RUO. Operators have challenged these prices. A decision by the NRA on the price dispute is expected.

Denmark: An additional DKK 514 is paid if there is no existing cable termination point.

Germany: Price valid until 31.03.2005.

Spain: Additional wiring within premises is invoiced separately.

Ireland: This connection charge applies where there is an existing metallic path. The monthly rental charge is currently being reviewed.

Italy: The ULL connection fee was 42.00 € from 01/01/04 to 16/06/04. It includes POTS and ADSL.

Cyprus: The incumbent operator has published its RUO. OCTPR will review this and issue its ruling. No OLO has yet negotiated an agreement .

Latvia: A single fee of Latvia L 27.08 is charged for the technical expertise in connection (included in the figure).

Hungary: Matáv charges 37644 HUF (included in the figure) to check whether the line is suitable for unbundling.

Finland: Weighted average of 41 SMP operators providing ULL. Prices vary between 7.9 and 22.1 € for the monthly rental and between 84 and 220 € for the connection.

Sweden: Orders placed and delivered at the same time at the same termination address: 1540 SEK for the first access, 790 SEK for additional accesses.

Figure 76

Figure 77

Estimates are based on the total cost for the loop for the first year.

7.4.2. *Prices for shared access local loop*

SA is not available in Estonia, Cyprus, Malta, Poland and Slovakia.

Belgium: The price is quoted exclusive of the splitter (€ 131/year for 48 splitters). A supplementary fee of €28.33 for disconnection is also charged.

Czech Republic: Price in the RUO. Operators have challenged these prices. A decision by the NRA on the price dispute is expected.

Denmark: An additional DKK 514 is paid if there is no existing cable termination point. The price does not include a splitter.

Germany: Price valid until 31.03.2005.

Spain: Additional wiring within premises is invoiced separately. Price is exclusive of splitter. An additional € 32.10 for POTS splitter and € 83.33 for RDSI splitter is charged if required.

France: Monthly rental price includes the price of the splitter.

Ireland: This connection charge applies where there is an existing metallic path. Price exclusive of splitter. The monthly rental charge is currently being reviewed.

Italy: The connection fee was 58,40 € from 01/01/04 to 16/06/04

Cyprus: The incumbent operator has published its RUO. No OLOs have negotiated an agreement yet.

Latvia: A single fee of Latvia L 27.08 is charged for the technical expertise in connection (included in the figure).

Luxembourg: Price of the splitter not included.

Hungary: Matáv charges 37644 HUF (included in the figure) to check whether the line is suitable for unbundling.

Slovenia: Price includes cost of splitter

Finland: Weighted average of 41 SMP operators providing ULL. Generally the monthly rental is 50% of the monthly rental of full ULL. Prices for the connection fee vary between 47 and 252 €.

Sweden: Orders placed and delivered at the same time at the same termination address: 1100 SEK for the first access, 790 SEK for accesses 2 to 20, 650 SEK for additional accesses.

Figure 78

Figure 79

Estimates are based on the total cost for the loop for the first year.

8. PUBLIC VOICE TELEPHONY TARIFFS

This section examines the charging system, the line rental charges and the main tariffs for public fixed voice telephony charged by the incumbent operators in each Member State in August 2004. The price trend over the past five years is also analysed.

The incumbent operators are: Belgacom for Belgium, Cesky Telecom for Czech Republic, TDC for Denmark, Deutsche Telekom for Germany, Elion for Estonia, OTE for Greece, Telefonica for Spain, France Telecom for France, Eircom for Ireland, Telecom Italia for Italy, CYTA for Cyprus, Lattelekom for Latvia, Lietuvos Telekomas for Lithuania, P&T Luxembourg for Luxembourg, Matav for Hungary, Maltacom for Malta, KPN for the Netherlands, Telekom Austria for Austria, Polish Telecom for Poland, Portugal Telecom for Portugal, Telekom Slovenije for Slovenia, Slovak Telecom for Slovakia, TeliaSonera for Finland (formerly Sonera), TeliaSonera for Sweden (formerly Telia), and British Telecom for the United Kingdom.

The incumbent operators still retain a large market share, but new entrants are increasingly gaining market share by offering cheaper prices for certain types of calls (usually long-distance or international) or destination. The prices charged by incumbents do not necessarily, therefore, represent the lowest prices available. A comparison between the rates charged by incumbents and alternative operators for a sample of countries is also shown.

The figures and information are taken from a study carried out for the Commission by Teligen-HI Europe. The data are collected from primary sources (i.e. directly from the incumbent operators).

NRAs were given the possibility to check these data before finalising this report. All NRAs, with the exception of Cyprus, Spain and Luxembourg, provided comments and endorsed these data.

Different sets of charges for fixed national voice telephony services are shown in the following sections:

- the minimum costs for different types of calls (local, long-distance, international calls and calls towards mobile networks), depending on the charging system adopted;
- the monthly rental charged by incumbent operators;
- the charges for a composite basket of calls (local, long-distance, international fixed calls and calls to mobile), that gives an estimate of the average monthly spending by a typical “European business/residential user” for the whole range (national and international) of calls;
- the charges for a basket of national calls, that gives an estimate of the average monthly spending by a typical “European business/residential user” for fixed national calls;
- the basket of international calls for each country that indicates the average price of a single call from the originating country to all other OECD destinations. In addition, the price of individual calls to specific destinations is also shown.

- the price of some individual calls (3- and 10-minute local, long-distance and international calls) at peak time, inclusive of any initial charge. For incumbents which apply unit-based charging, the price of a whole unit is calculated.

For the various types of calls, a benchmark based on a comparison with US and Japan is also included. For the USA, the prices for national calls are those charged by Verizon (in New York city) and the prices for international calls are those charged by AT&T. For Japan, the national call prices are those charged by NTT and the international call prices are those charged by KDD.

The EU average tariffs shown in the charts are weighted average (by population of the Member States).

8.1. Charging system

The billing system for public voice telephony services usually comprises two components: an initial charge applied at the beginning of a call and a charge for the remainder of the call (that may not depend on the type of initial charge used).

8.1.1. Initial charges

There are different types of charges applied at the beginning of a call, either alone or in combination. The charging method used for the remainder of the call may not depend on the type of initial charge used. The types of charges are:

- Call set-up charge raised at the start of the call (when the call is answered). This charge does not offer any call time. Per second or per unit charges apply from the beginning of the call.
- Initial charge that is used in the same way as call set-up, but in addition includes a certain number of seconds call time before normal time-based charging starts.
- The unit charge in effect works the same way as the initial charge: A full unit is charged at the beginning of the call, providing a certain number of seconds call time until the next unit is charged. Depending on the principle used by the operator (synchronous/asynchronous) the number of seconds call time in the first unit may be less than the specified unit duration.
- Minimum charging is normally used with per second billing, to ensure the operator obtains a minimum revenue per call. If the call duration is short, the actual call charge may be less than the minimum charge. In such cases the minimum charge will be applied.

In the calculation of the minimum charge for calls using per second billing the first second of the calls (after it is answered) is not included, even though this can also be perceived as part of the minimum cost.

8.1.2. Charging system during the call

There are, in principle, 3 ways of charging calls. The fact that most operators tend to publish the duration charges on a per minute basis does not itself indicate which system is used. The 3 principles are:

1. Real time charging (also known as “per second billing”) allows the cost of the call to be calculated to the exact duration of the call (normally nearest second). A call set-up charge, initial charge or minimum charge may be applied to this structure, in addition to the duration charge.
2. Unit based charging uses a fixed price unit. The duration of this unit will vary with the destination of the call and time of day. Call duration will always be raised to a multiple of whole units, so the user will nearly always pay for more time than is used. A call set-up charge may be applied to this structure, but is relatively rare.
3. Fixed period charging uses a variable price, but fixed duration unit. The call is normally charged on a per minute basis, or per 6 seconds. The price for the period will vary with destination and time of day. The charged duration of the call will be raised to a multiple of whole periods. A call set-up charge or initial charge is often implemented in the form of a higher charge for the first minute or period. This initial charge may vary with destination and time of day.

Call set-up charges may vary according to the type of call (local, long-distance, international, calls to mobile), and for international calls according to destination. In the case of international calls, the minimum cost of a call may change according to the destination.

The following charts show the minimum cost, due to initial charges, for local, long-distance and international calls and calls to mobile charged by the incumbent operators. The free call time (i.e. the number of seconds of call time before normal time-based charging starts) is shown in brackets. Values are expressed in €, including VAT. It should be noted that while some operators apply identical set-up charges to local and long-distance calls, the free call times can vary.

Figure 80

There is no difference for the minimum cost of a local and a long-distance call in Belgium, Cyprus, Denmark, Estonia, Hungary, Ireland, Latvia, Lithuania, Slovenia, Sweden, United Kingdom and US.

Figure 81

Initial charges for international calls will normally follow similar rules as for national calls. In the case of Greece no minimum or call setup charges are reported by the operator and the prices shown refer to the 1st second. Where unit based charging is used the initial period duration covered by the first unit may change with the destination. In most countries prices are the same for business and residential customers. Differences may occur in Austria, France, the UK and USA.

Figure 82

8.2. Monthly rental charged by the incumbent operators

The following charts show the incumbent’s monthly line rental charges for residential and business users in August 2004 and the variation in nominal terms in each country since August 1998. In order to reflect the real charges actually paid by users, values are expressed in €, including VAT for residential users and excluding VAT for business users.

In Italy, Sweden, the UK, USA and Japan the rental charges are different for business and residential customers. In Austria two different packages have been chosen as appropriate for business (Business 1) and residential users (TikTak Privat), hence different packages. In the UK the residential package changed in 2004, after BT abandoned the Residential Standard Tariff. The “BT Together Option 1” tariff is used. In Finland and Japan the monthly rental will depend on where in the country the line is connected. The charges shown are for the capital/most densely populated area.

Figure 83

Figure 84

The following charts show the EU weighted average variation in nominal terms of the residential and business monthly line rental charge. Averages for the EU25, EU15 and EU10 are presented.

Figure 85

Figure 86

8.3. Average monthly expenditure (composite call basket)

The figures presented in this section are intended to provide an estimate of the average monthly expenditure of a “standard” European consumer (business and residential). The Basket Methodology for Telecommunications Cost Comparison has been devised by the OECD and accepted in most countries as the most stable and neutral method of comparison.

A full description of the methodology can be found in “Performance indicators for public telecommunications operators”, ICCP Series No.2.2, OECD 1990.

The user is assumed to have a contract for the provision of voice telephony services with the incumbent operator, and to use only this operator for all types of calls (local, long-distance, international, calls to mobile). Since consumers are making increasing use of call-by-call carrier selection, in particular for specific highly discounted types of calls (i.e. international

and long-distance), the figures given below are purely indicative, and do not necessarily reflect the cheapest solution available.

The charts below show the average monthly expenditure for standard residential and business users as of August 2004, expressed in €, based on the standard tariffs charged by the incumbent operators (i.e. excluding any discount packages). This means that lower costs can be achieved if the user subscribes to one or more discounted packages.

The basket of calls used to estimate average monthly expenditure is the new “composite OECD basket” which includes not only fixed national calls (as did the old basket), but also fixed international calls and calls to mobile networks. The revised OECD baskets were adopted in May 2000.

The OECD residential/business baskets are defined as follows (on an annual basis):

The fixed (i.e. non-recurring) charges include the annual line rental charge plus the charge for the installation of a new line (depreciated over 5 years). Fixed charges for residential users include VAT, while for business users VAT is excluded.

The usage charge for residential users refers to a basket of 1.200 national calls to fixed lines, plus 120 calls (with an average duration of 2 minutes) to mobile networks (Representing 10% of the number of calls to fixed lines), plus 72 international calls (Representing 6% of the number of calls to fixed lines). The usage charges for national calls to fixed lines are calculated with a weighted distribution over 14 distances from 3 to 490 km, at representative times of day (4 calls during the week and 2 during the weekend). The call duration varies from 2.5 to 7 minutes, depending on time and distance. The usage for residential users is weighted towards off-peak hours, and with typically long calls. Only 36% of the calls are within normal business hours; 64% are for distances below 10 km; 9% are for distances above 100 km.

The usage charge for business users refers to a basket of 3 600 national calls to fixed lines plus 360 calls (with an average call duration of 2 minutes) to mobile networks, plus 216 international calls. The usage charges for national calls to fixed lines are calculated with a weighted distribution over 14 distances from 3 to 490 km, at representative times of day (4 calls during the week and 2 during the weekend), and with a call duration of 3.5 minutes regardless of time of day and distance. The usage for business users is weighted towards business hours, and with typically short calls. Over 86% of the calls are within normal business hours; 64% are for distances below 10km; 12.5% are for distances above 100 km.

A full description of the methodology can be found at the end of this report.

Figure 87

Figure 88

8.4. Price of fixed national calls by the incumbent operator

8.4.1. Prices charged by the incumbent operators for individual fixed national calls

This section shows the prices charged by the incumbent operators for individual fixed calls (the same call prices apply to business and residential users). Where the incumbent operator uses a unit-based charging system, the price of calls of different duration and/or distances may in some cases be identical, where both calls are charged the same number of units. Any call set-up charges, minimum charges and/or call specific duration allowances have been taken into account.

Prices refer to peak hours (weekdays 11.00) and are expressed in € including VAT. Except where otherwise specified, the figures refer to August 2004.

Prices are indicated for three-minute and ten-minute calls over two distances: 3 km (equivalent to a local call) and 200 km (equivalent to a national call). In several countries the tariff changes at exactly one of these distances: in these cases, the rates for the lower distance band are used.

The price of a three-minute call is more affected by the magnitude of the call set-up charge than the price of a ten-minute call.

Where different tariff packages exist, the basic, residential package is selected. Otherwise the standard tariff is used. The “TikTak Privat” Package is used in Austria, “BelBasic” in the Netherlands and “BT Together Option 1” in the UK. No discount packages are taken into account.

The EU average value is the average of the EU countries weighted according to the national population.

Figure 89

Figure 90

Figure 91

Figure 93

Figure 94

8.5. Trend of the basket for fixed national calls (national basket)

Figure 95

Figure 96

Since 2000 all EU25 MS are included except Malta, which is included since 2003.

8.6. Price of fixed national calls by alternative operators

This section compares the prices charged for public voice telephony services by the incumbent operators in a sample of EU Member States and by the largest competitor in each Member State. The tariff packages selected will impact on this comparison, although care has been taken to ensure reasonable comparability.

Figure 97

TG in Latvia have charges several times above the incumbent. The representation in the graph has been reduced 5 times to maintain a sensible representation of other countries.

Figure 98

TG in Latvia have charges several times above the incumbent. The representation in the graph has been reduced 5 times to maintain a sensible representation of other countries.

Figure 99

Figure 100

TG in Latvia have charges several times above the incumbent. The representation in the graph has been reduced 5 times to maintain a sensible representation of other countries.

8.7. Incumbent operator price for an average fixed international call (international call basket)

The basket of international calls for each country provides an estimate of the average cost of an international call.

For the basket comparison of international PSTN call charges, the OECD traffic weight basket methodology is used. The basket calculates an average charge for calls to all OECD destination countries.

The residential basket includes VAT. Call charges are weighted between peak and off-peak hours: 25% for peak hours and 75% for off-peak hours. The business basket excludes VAT. Call charges are weighted 75% for peak hours and 25% for off-peak hours. The average price of an international call is lower for business users than for residential users because of the heavier weighting given to three-minute peak-hour calls, which are, on average, cheaper than five-minute off-peak calls, and because VAT is excluded for business users but included for residential users.

International call charges vary widely with the destination, and the basket results are based on a weighted average call charge. Traffic weighting is used, as defined by the OECD for the destination weighting, as per the revision in 2000. This method applies a weight to each destination based on the traffic volumes reported on that route (ITU statistics).

All tariffs are standard prices from ex-incumbents operators, and both these operators and new entrants may offer lower prices.

The EU average value is the average of the EU countries weighted according to the national population.

A full description of the methodology can be found at the end of this report.

Figure 101

Figure 102

Figure 103

8.8. Incumbent operator price of calls to EU, Japan, USA

The following two charts show the prices of a 10-minute international call (including VAT) during peak hours (weekday 11.00AM) to four different destinations: Near EU country, Distant EU country, USA and Japan. Figures are expressed in € at August 2004 values, including VAT, and they refer to the European incumbent operators and the EU weighted average. The table below summarises the definition of near and distant EU destination countries.

8.9. Alternative operators' price for fixed international calls

The equivalent prices for competitor providers in the EU countries are shown in the charts below. One competitor per country has been analysed. The prices are shown for a 10 minute call, at peak time weekdays.

Prices include VAT and are applicable for August 2004.

Figure 108

Figure 109

Figure 110

Figure 111

9. LEASED LINES RETAIL TARIFFS

This section contains an overview of prices charged by incumbent operators to end users in each Member State for national and international leased line services as at 1 August 2004. Figures do not cover wholesale prices. Price developments are also analysed over the period August 2000-2004.

The figures and the information are taken from a study carried out by Teligen-HI Europe for the Commission. Data on standard retail prices charged by incumbent operators have been collected in each country.

9.1. Incumbents' national leased lines

National leased line data is provided for 2003 and 2004. Two distances are covered: 2 km (local circuits), and 200 km. Tariffs are taken from the incumbent operator in each country. Other operators may offer other prices. In order to properly reflect the tariff structures used in some countries, the circuits may be considered in one of two different ways, depending on tariff structure. The one to apply will differ from carrier to carrier. The principles used in this report for calculating the price of a full circuit are:

	1: When tariff specifies local tail prices separately, in addition to main circuit.		2: When tariff specifies a single price for the circuit, end to end, including local tails.	
	Local tail length	Main circuit length	Local tail length	Main circuit length
2 km circuit	1 km	0	0	2 km
200 km circuit	2 km	196 km	0	200 km

Note: The local tail length is per tail, i.e. there will be 2 such tails with each circuit.

Where several tariff options exist depending on type of location, the criteria for choice is as follows:

- 2 km circuits are always within a major city (usually the Capital)
- 200 km circuits are between a major city and a “minor” city

As the definitions vary between countries, the type of tariff option chosen will also vary (see details below). The countries where the price may vary with location or other non-distance related definitions are: Belgium, France, Austria, Finland, Sweden and the UK.

Some operators apply termination charges per local end, without necessarily covering the local tail circuit within that charge.

4 types of circuits are covered: 64 kb/s, 2 Mb/s, 34 Mb/s and 155 Mbit/s. As not all carriers publish tariffs for all these bitrates and all years, there may be some gaps in the information, especially for higher bitrates.

Some carriers offer 2 Mb/s circuits as both structured and unstructured. In this analysis only unstructured circuits are included.

Also, some carriers offer different types of leased lines, often in the form of “basic circuits” and circuits in a managed network. Only “basic circuits” are included in this analysis, as the managed network services are not comparable between carriers.

Lately a few carriers have decided not to publish their prices for some or all types of leased lines. This makes it increasingly difficult to present a full overview of the prices in all 25 EU countries.

For the USA the prices of Verizon intra-LATA circuits for New York State have been used. The bitrates of leased lines offered in some countries may be different from the ones found in most EU member States. Some operators may offer 56 kb/s instead of 64 kb/s, 1.5 Mb/s instead of 2 Mb/s, 45 or 50 Mb/s instead of 34 Mb/s, and 140 or 150 Mb/s instead of 155 Mb/s. Prices shown in the tables and graphs in this section of the report have been adjusted according to the difference in capacity.

All prices are presented in EURO per year, excluding VAT.

National leased lines prices as at 1 August 2004.

The validity dates of the tariffs used in this section are:

	Valid date		Valid date
Belgium	01/06/04	Hungary	01/01/02
Czech Rep.	01/05/03	Malta	01/07/03

Lithuania	27/06/03	USA, Verizon	01/01/03
Luxembourg	01/01/02	USA, Pacbell	08/08/02

BE: Belgacom has divided its network into 4 levels based on “economic concentration”. The tariffs shown are for circuits within or between level 1 areas, “Very high economic concentration”. Prices for 155 Mb/s shown here are adjusted from prices for 140 Mb/s

circuits. Local circuits within an exchange area are priced as a regular circuit of the given distance.

CZ: Cesky Telecom defines prices for all bit rates based on the price of a 64 kb/s circuit. Coefficients are given for each bit rate available (up to 2 Mb/s), and the price is the product of the 64 kb/s price and the coefficient. Local circuits are defined as a 0 km circuit. 10 distance zones are defined for circuits with more than 0 km between serving exchanges. There are no incremental charges (i.e. per km).

DK: TDC divides the leased lines into two categories: Local circuits based on distance bands and whether the two ends are connected to the same exchange or neighbouring exchanges. Long distance circuits connected to different exchanges, divided into 4 distance bands. There are no incremental charges (e.g. per km). Prices for 155 Mb/s shown here are adjusted from prices for 140 Mb/s circuits.

DE: Deutsche Telekom offers different types of circuits. In this analysis the “Standard Festverbindungen” is used. Tariffs are divided into: a) Local 1 (same exchange); b) Local 2, up to or above 15 km; c) Long Distance, < 15km, 15 – 50 km, 50 – 150 km, > 150 km. Local 2 and Long distance use incremental (per km) charges. At 34Mb/s and 155 Mb/s access circuit charges apply, with a distance (per km) element.

EE: Elion divides the leased lines into distance bands of 0 – 6 km, 6 – 10 km, 10 – 20 km, >20 km. Trunk circuits above 20 km use incremental (per km) charges. Local circuits are priced as a regular circuit of the given length.

EL: OTE divides the leased lines into: a) Local circuits, b) Trunk circuits (< 35 km, 35 – 70 km, 70 – 150 km, > 150 km). Trunk circuits use incremental (per km) charges. 64 kb/s charges are for Hellascom service from 2003.

ES: Telefonica strictly divides leased lines according to distance: a) Distance bands: 0 – 4 km, 4 – 20 km, 20 – 70 km, 70 – 300 km, 300 – 500 km, > 500 km. All bands use incremental (per km) charges. Telefonica does not publish prices for 155 Mb/s circuits. Local circuits within an exchange area are priced as a regular circuit of the given distance.

FR: France Telecom offers leased lines in the products Transfix and Transfix 2.0. Transfix is the basic service, and the one used in this analysis. The tariff is divided into distance bands: 0 – 10 km, 10 – 50 km, 50 – 300 km, > 300 km. 34 and 155 Mb/s divide at 30 km and 100 km instead of 50 km. Prices for 2 Mb/s relate to 2,048 kb/s bit rate. 1,920 and 1,984 have different prices. Prices for 34 and 155 Mb/s circuits relate to circuits with one end in a major city (zone A), as defined by France Telecom. Local circuits within an exchange area are priced as a circuit of the given distance. Additional definitions apply for higher speed circuits.

IE: EirCom define the tariff for leased lines with a local end charge, and main link charges for circuits 0 – 30 km and > 30 km. Local circuits may be made up by 2 local ends, and no main link. Circuits equal to or above 1 Mb/s have a distance incremental charge for local ends over 1.5 km.

IT: All circuits have an access charge per end, and a main link distance related charge per km. Distance bands are 0 – 60 km, 60 – 300 km, and > 300 km. Circuits from 2 Mb/s and above are available with various levels of reduced charges depending on contract period and overall spend. The most basic level is used in this analysis. Local circuits within an exchange area are priced as two access circuits only.

CY: CYTA divides the leased lines into: a) Subscriber segment, for access. b) Network segment, between exchanges, at distance bands of 0 – 20 km, 20 – 80 km, > 80 km. Local circuits within an exchange area are priced as two subscriber segments.

LV: Lattelekom circuits have the same price regardless of distance. Prices are only provided for circuits up to 2 Mb/s.

LT: Lietuvos Telekomas distinguish between circuits inside the local exchange area, and those beyond the local exchange area.

LU: P&T Luxembourg divide the leased lines tariff into 4 types of circuits: Same local network, contiguous local network of same nodal sector, same nodal sector or contiguous local networks of different nodal sectors, and non-contiguous local networks of different

nodal sectors. This definition relates to the network hierarchy, and not to distance. Distances at 200 km are not possible.

HU: Matav applies an access circuit charge for each end of the circuit, and a fixed basic charge and a per km charge for the trunk part.

MT: Maltacom has a flat charge regardless of distance, only dependent of bitrate.

NL: KPN Telecom offer leased lines as Digital Standard and DigiStream services. Digital Standard is the basic service, and the one used in this analysis. Tariffs are divided into a charge per connecting point and a main link charge. The main link charge is divided into two zones: Up to 50 km with a fixed basic charge and an incremental per km charge, and over 50 km with a fixed basic charge. Prices are in effect capped above 50 km. Prices for 34 and 155 Mb/s circuits are not published. Local circuits within an exchange area are priced as two access connections plus a short main link of the given distance.

AT: Telecom Austria divides the “Digitaler Stromweg” circuits into 2 categories: City-tarif when both ends of the circuit are in category A cities (a defined list of 68 towns and cities), and Normal-tarif when the above does not apply. This analysis used the City-Tarif. The Normal-tarif would in most cases come out more expensive. For the years up to 2000 a different tariff scheme applied, with a different list of towns, and 3 instead of 2 categories. The tariff is based on a charge per local end, and a distance related charge per km. The distance bands vary with bit rate. Local circuits within an exchange area are priced as two access circuits only.

PL: Polish Telecom have no recurring charges related to the access. A basic charge plus a per km charge is applied for the full length of the circuit. Distance bands are divided into 0 – 3 km, 3 – 20 km, 20 – 30 km, 30 – 50 km, 50 – 100 km, 100 – 200 km, over 200 km.

PT: Portugal Telecom divides the leased line tariff into local access circuit charge, and a main link with a fixed and an incremental charge per km. Distance bands are 0 – 10 km, 10 – 30 km, 30 – 50 km, 50 – 100 km, over 100 km. Local circuits connected to the same exchange will not incur main link charges. Local circuits within an exchange area are priced as two access circuits only.

SI: Telekom Slovenije divides the leased line tariffs into 3 distance bands: 0 – 5 km, 5 – 50 km and over 50 km. Each of these bands have a basic price and a per km price. Distance is calculated between serving exchanges.

SK: Slovak Telecom defines the leased line tariff in two parts: Local Access and Intercity. The Intercity part is divided into 3 distance bands: 0 – 50 km, 50 – 100 km and over 100 km. Prices are given for the 64 kb/s bitrate. Other bitrates between 9.6 kb/s and 2048 kb/s are calculated based on the 64 kb/s price using a multiplication factor. This factor is different for Local Access and Intercity circuit parts. For example 2048 kb/s has a factor of 4.4 for the Local Access and 5.6 for the Intercity part

FI: Sonera stopped publishing full 64 kb/s circuit prices in 1998, and have also stopped publishing 2 Mb/s circuit prices. Local circuit charges were divided into 3 categories: Urban area, Rural areas I and II. Definitions of these areas relate to individual locations in the Sonera coverage area. Long distance (main link) charges were also divided into 3 categories: Green, Red and Blue. Green covers the main 5 cities, red a further 28 towns, and Blue the rest of the

countries. Distance bands are 0 – 50 km, 50 – 100 km, and > 100 km. Incremental charges per km applied.

SE: Telia divides their network into 5 categories: Metropolitan green and green for the major cities and towns, red and blue for short distance network in smaller places, and white for rural areas. Circuits are priced according to the portion of the circuit falling into any of these categories on its route. Here the green tariff is assumed, for a circuit between reasonably large towns. The tariff is divided into local circuits and long distance. Long distance circuits will have a separate access link charge per end, and a main link charge. Local circuits are priced in 2 distance bands: 0 – 0.5 km and 0.5 - 3 km. Long distance circuits are priced in the bands 0 – 20 km, 20 – 40 km, and > 40 km. The latter has an incremental per km charge. Circuits at 34 Mb/s and 140/155 Mb/s are no longer offered by Telia. Instead other services are offered, as complete network solutions.

UK: BT divides their Kilostream (64 kb/s) and Megastream (2, 34 and 155 Mb/s) tariffs into circuits wholly within City London Zone (0207-area), and circuits with one or both ends outside London. For local circuits within CLZ the main link does not apply since both ends are connected to the same exchange (according to the definition used). The price is calculated as the sum of two local access circuits. Distance bands outside London are < 15 km and > 15 km. Incremental charges per km applies.

9.2. National leased lines price trends (1 august 1998 - 1 august 2003)

Figure 120

Figure 121

Figure 122

9.3. International leased lines prices

This section examines the standard retail prices (annual rental) for international leased line services (half-circuits in each country) charged by the incumbent operators in each Member State. An analysis of the price development over the period from August 2000 to August 2004 is also included.

Three destinations are covered: international half circuits to the nearest EU country (hereafter “near EU”), to the most distant EU country (“far EU”) and to the USA.

Three types of circuits are considered: digital 64 Kbit/s, 2 Mbit/s and 34 Mbit/s. Given that price information on 155 Mbit/s international lines is only available for a few Member States, the analysis of these circuits is omitted.

The data is presented with the following parameters:

- All charges in Euro per month
- Excluding VAT
- The years from 2000 are covered
- Variable / 1 year contract (shortest term available).
- AT&T prices are used for USA

The analysis shows that the prices of international half-circuit from all of the New Member States are much lower than from the EU15 countries, with a factor of around 1:6.

9.3.1. 64 Kbit/s

11. OECD TELECOMMUNICATIONS BASKET DEFINITIONS

11.1 National PSTN basket

Business basket results exclude VAT. Residential basket results include VAT.

The non-recurring charge is calculated as an average between the charge for a new line installation, and the charge for “same day takeover”, i.e. when there is a direct transfer from the previous to the new customer. Valid for both Business and Residential baskets.

Non-recurring charge calculation	Weight
New line connection charge	50%
Same day takeover connection charge	50%

The non-recurring charge is depreciated over 5 years. An exception is made for countries where the connection charge has a lifetime value (e.g. Japan, where the connection is a tradable asset). Valid for both Business and Residential baskets.

Non-recurring charge depreciation	Weight
With normal one-off charge	5
Where connection is a tradable asset	20

Annual rental for the service is included in the basket. Any additional recurring charges (per year) shall also be included (e.g. charges related to the use of specific calling plans).

Where the service (or tariff plan) includes a number of “free” calls or minutes, or any other call-related allowance, the value of this allowance is deducted from the usage. The value of the deducted allowance cannot be higher than the usage. Where the tariff clearly specifies that the allowance is related to specific types of calls (e.g. local, international), the usage in question shall only cover the defined type(s) of calls.

The number of calls to fixed line phones (i.e. excluding calls to mobile phones) is defined as:

Number of national fixed line calls	Calls per year
Business basket	3600
Residential basket	1200

The national usage will have a weighted distribution over 14 distances. Call charges relevant at each of these distances shall be used.

Km	3	7	12	17	22	27	40	75	110	135	175	250	350	490
Bus	53	11	7	4	2.5	3	3.5	3.5	2.5	2	1.5	1.5	1	4
Res	60	14	5	3	1.5	2.5	2.5	2.5	1.5	1.25	1	1	0.75	3.5

Bus = Business basket, Res = Residential basket. All weights in percent of total number of fixed line calls.

The national usage will have a weighted distribution over six time and day points. Call charges relevant at each of these time and day points shall be used.

Day/Time	We 11:00	We 15:00	We 20:00	We 03:00	Sa 11:00	Su 15:00
Bus	45.4	40.6	7	0.8	5.7	0.5
Res	14.3	22.1	31.6	3	13	16

Bus = Business basket, Res = Residential basket. All weights in percent of total number of fixed line calls.

We = Weekdays, Sa = Saturdays, Su = Sundays.

National call duration will vary with distance and time of day. The charge for each call shall reflect the actual charge for the duration in question, as defined by the tariff. Call setup and minimum charges shall be included.

Day/Time	Weekday daytime			Weekday evenings, nights and weekends		
	3-12 Km	17-40 Km	75-490 km	3-12 km	17-40 Km	75-490 Km
Bus	3.5	3.5	3.5	3.5	3.5	3.5
Res	2.5	3.5	3.5	3.5	6	7

Bus = Business basket, Res = Residential basket. Duration in minutes per call.

Calls to mobile phones may be added to the basket. This is optional, and the presentation of the results must clearly state whether such calls are included or not. The number of calls shall be 10% of the number of national fixed line calls, in addition to the fixed line calls.

Calls to mobile phones	Calls per year	Call duration
Business basket	360	2
Residential basket	120	2

Call duration in minutes per call.

11.2. International PSTN basket

The international PSTN basket, when used separately, shall reflect the cost of a single call, calculated according to the weighting method described below. No fixed charges are included.

Business basket results exclude VAT. Residential basket results include VAT.

Call charges for calls to all other OECD Member States shall be used. Peak and off-peak time call charges are used, defined as the highest (most expensive) charge and the lowest (least expensive) charge.

Call cost is based on average per minute charge. Call setup charges and/or different charges for first and additional minutes are included.

The charges to different destinations are weighted according to the ITU call volume statistics. An average over the latest 5 years of available traffic statistics is used. As there may be gaps in the ITU statistics for certain destinations from some countries, calls on such routes are excluded from the calculation.

Call charges are weighted between peak and off-peak:

	Peak time weight	Off-peak time weight
Business basket	75.0 %	25.0 %
Residential Basket	25.0 %	75.0 %

Call duration differ between peak and off-peak time:

	Peak time	Off-peak time
Business basket	3 minutes	5 minutes
Residential Basket	3 minutes	5 minutes

11.3. Composite national – international basket

This basket is based on a combination of the national and international baskets, as described above. The national basket remains unchanged, and the international basket is scaled using a fixed number of international calls.

Business basket results exclude VAT. Residential basket results include VAT.

The international portion of the basket shall have a number of calls equal to 6% of the national fixed line calls, in addition to the calls defined in the national portion of the basket.

	International calls per year
Business basket	216
Residential basket	72

11.4. New OECD Mobile Baskets

All baskets will include:

Registration or installation charges with 1/3 of the charges, i.e. distributed over 3 years.

Monthly rental charges, and any option charges that may apply to the package, or package combination.

The three new baskets are:

Low user basket. The usage level of this basket is low, with a call volume less than half of that in the Medium user basket.

Medium user basket. This basket will have 75 outgoing calls per month.

High user basket. The usage level is about twice the Medium user basket.

The usage profiles will also include a number of SMS messages per month.

Call and message volumes for each basket are:

	Outgoing calls /month	SMS per month
Low user	25	30
Medium user	75	35
High user	150	42

The information received showed that there is little difference between the average pre-paid usage and the low user post-paid usage. The low user basket can therefore be used for both pre- and post-paid tariffs, allowing a simple comparison also between the two types.

Only national calls are included in the profiles, with 4 different destinations:

Local area fixed line calls. This is used to accommodate the tariffs that have separate charges for the local area. When such charges are not available, this proportion of calls is included in the National.

National fixed line calls. This covers all fixed line calls outside the local area, except in cases as noted above.

Same network mobile calls (On-net). This includes all calls made to mobiles in the same mobile network as the caller.

Other network mobile calls (Off-net). This includes calls to all other mobile networks in the caller's country. When the charges are different depending on destination network, the market shares based on subscriber numbers are used for weighting the charges. Up to 3 other networks will be considered in each country.

Distributions per destination for each basket are:

% of total number of calls	Fixed Local area	Fixed area	National	On-net mobile	Off-net mobile
Low user	28.0%	14.0%		40.0%	18.0%
Medium user	24.0%	12.0%		43.0%	21.0%
High user	26.0%	14.0%		42.0%	18.0%

As the information received produced little evidence on the split between local and national fixed line calls, the assumption has been used that the ratio would be 2:1 for local:national, i.e. 67% local and 33% national. This assumption is taken from the averages in fixed baskets, and the scarce information received.

Instead of splitting time and day into distinct times and days the following approach will be used:

Peak time calls at weekdays, most expensive time during daytime.

Off-peak time calls at weekdays, cheapest time before midnight.

Weekend time calls, at daytime Sundays.

Distributions over time and day for each basket are:

% of total number of calls	ToD Peak	ToD Off-peak	ToD Weekend
Low user	38.0%	35.0%	27.0%
Medium user	47.0%	30.0%	23.0%
High user	63.0%	22.0%	15.0%

There will be 3 separate call durations:

Local and national fixed line calls

Same network mobile calls (On-net)

Other network mobile calls (Off-net)

Call durations for each basket are:

Minutes per call	Dur Fixed National	Dur On-net	MobileDur Off-net	Mobile
Low user	1.6	1.4	1.4	
Medium user	2.1	1.9	1.9	
High user	2.2	2.0	2.1	

Any call allowance value included in the monthly rental will be deducted from the usage value once the basket is calculated. The deduction cannot be larger than the actual usage value, i.e. negative usage is not allowed. No transfer of unused value to next month is taken into account.

Any inclusive minutes will be deducted from the basket usage before starting the calculation of usage cost. The inclusive minutes are assumed to be used up with the same calling pattern that is described in the basket, i.e. the same peak/off-peak ratio and the same distribution across destinations. Where the inclusive minutes are clearly limited to specific destinations or times of day this will be taken into account. No transfer of unused minutes is taken into account.

Any inclusive SMS-messages will be deducted from the basket before starting the calculation of the SMS message cost, up to the number of messages in the basket.

For each of the operators covered a set of packages shall be included so that the cheapest package offered by that operator can be calculated for each of the 3 baskets.

Multiple operators in each country shall be included, with at least the two operators with highest number of subscribers in each country. The operators included shall have a total market share of at least 50% based on subscriber numbers.

Basket results are calculated for a period of one year.
